54116. POWELL, DONALD E., *and* A. E. PETERSON. Experimental fishing to determine distribution of salmon in the North Pacific. Washington, D.C., July 1957. 30 p. illus., tables, map. (U.S. Fish and Wildlife Service. Special scientific reports, fisheries, no. 205.)

Account of investigation conducted during the summer and early fall of 1955 by three fishing vessels. Gill net operations in the Gulf of Alaska and south of the Aleutians and the Alaska Peninsula showed a wide distribution of North American species of salmon and of steelhead trout at that time of the year. Catch and size analyses of these species are presented graphically. South of about 47° N. albacore was found to replace salmon in the catches.

54117. POWER, GEOFFREY. The evolution of the freshwater races of the Atlantic salmon, *Salmo salar* L. in eastern North America. (Arctic, 1958. v. 11, no. 2, p. 86–92, illus., tables.) 9 refs.

Information is presented on distribution of landlocked salmon, including the Hamilton, Upper George, Koksoak and Larch Rivers, Knob and other lakes in Quebec-Labrador. Size, weight and growth rate are given on the Ouananiche (landlocked) salmon of Lakes Astray and Aigneau. Theories on the origin and distribution of Atlantic freshwater salmon are discussed; effects of climate and isolation are considered.

54118. POWER, GEOFFREY. Salmon investigations on the Koksoak River, 1957. (Arctic, 1958. v. 11, no. 1, p. 63–64.)

Notes salmon population studies on this river in northern Quebec and its two major tributaries, the Larch, where most of the fish spawn, and the Kaniapiskau. The Eskimo salmon fishery at Fort Chimo is discussed and improvement suggested in view of the need of salmon for dog food. Physiological studies on the speckled trout and the Atlantic salmon were continued: measurements of basal oxygen consumption under different temperature regimes, etc.

Natural conditions peculiar to Yakut A.S.S.R. are described: the severe cold, permafrost conditions, and forest distribution. Statistical data are given on growth, cutting and destruction of various tree species for the different zones. Larch predominates (88%) and grows above the Arctic Circle along the Yana River as far north as the Khatanga (72°30′ N.), and on mountain slopes up to 1200 m. The height, diameter and volume of the larch trees are tabulated for different ages (40–200 years) and river basins such as Yana, Vitim and Olekma. Fire is the major cause of forest destruction affecting about one-fifth of the forest areas. Fire prevention and reforestation of burned areas are considered the most urgent problems in future planning. Distribution of forests in various localities of the Yakut Republic is described in detail. ***Copy seen:*** DLC.

Text in Russian. ***Title tr.:*** Study and development of the natural resources of Siberia; itinerant Session of the Biological Sciences Section.

Summary of papers delivered at meetings Nov. 20–24, 1956, called jointly by the Section and the West-Siberian Branch of the Academy. The results on biological research on the West Siberian vegetation cover conducted over a twelve-year period were presented by A. I. Cherepanov and K. A. Sobolevskiĭ. The Forest Institute Laboratory has prepared a monographic description of forests and their topology, stressing their role as a protective zone for river water resources. Combined studies of soils, vegetation, forests and hydroflora were reported especially for the Novosibirsk region of future water resource development. A paper on taiga forest conservation was presented by I. S. Melekhov, noting the timber and fur resources. Taiga forest problems should be studied by scientific and educational organizations cooperating in a common program. Economic-biological investigations carried on by Yakut Branch in the Vilyuy basin and by East-Siberian Branch in Podkamennaya Tunguska basin are noted in a paper delivered by V. B. Sochava.

54128. *PRECAMBRIAN.* Alberta (Precambrian, Feb. 1957. v. 30, no. 2, p. 12–16, 2 illus.)

Includes information on mines, mining and exploration in Northwest Territories and Yukon, where 1956 mineral production was valued at $22,949,100, and $15,678,900. Uranium property at Marian River north of Yellowknife, and nickel mines at Rankin Inlet on Hudson Bay come into production in 1957. Yukon explorations, etc. include: asbestos on Cassiar Creek, potential lead-zinc deposits near Whitehorse region; Kluane area copper-nickel deposit; oil drilling on Peel River. Summer 1957 plans are indicated: airborne geological reconnaissance of 100,000 sq. mi. in the upper Mackenzie region; Geological Survey of Canada work in Yukon mineral areas, and preparations for "Operation Pelly," a 1958 airborne reconnaissance in Pelly River region. ***Copy seen:*** DGS.

54129. *PRECAMBRIAN.* Geological Survey places 72 parties in the field. (Precambrian, June 1957. v. 30, no. 6, p. 28–30.)

Canada's 1957 field program includes: "Operation Mackenzie," reconnaissance mapping by helicopters of 100,000 sq. mi. of oil and gas territory in the upper Mackenzie basin; "Operation Fort George," helicopter mapping of 35,000–40,000 sq. mi. in northern Quebec, 52°–56° N. and east from the Hudson - James Bay coast to 68° W. (to be continued in 1958). Along the Manitoba-Keewatin boundary, 59°–60° N. 100°–102° W., aeromagnetic

mapping of approx. 28,000 sq. mi. is to complete a 1956 survey. In the Canadian Arctic Islands, four parties are to carry out exploratory mapping to within 600 mi. of the Pole. ***Copy seen:*** DGS.

54130. *PRECAMBRIAN.* Last spike. (Precambrian, Oct. 1957. v. 30, no. 10, p. 8–10, 6 illus.)

Railroad spur (22-mi.) from Sipiwesk on the Hudson Bay Railway to International Nickel Company's new mining town of Thompson in the Mystery-Moak Lakes area of northern Manitoba (55°51′ N. 97°43′ W.) was completed in Oct. 1957; two shafts had been sunk at the mine and temporary quarters built for 800 workers. Smelter, concentrator and refinery construction, also housing for approx. 8,000 people (2,000 workers) are to begin. Nickel production is to start in 1960, and reach 75,000,000 pounds annually. ***Copy seen:*** DGS.

54131. *PRECAMBRIAN.* Manitoba. (Precambrian, Feb. 1957. v. 30, no. 2, p. 28–32, 2 illus.)

International Nickel Co. of New York is to develop low grade nickel deposits in the Moak-Mystery Lakes area: Hudson Bay Mining and Smelting Co. plans to develop three orebodies in the Snow-Herb Lake region; drilling on copper-nickel deposits at Herb Lake area is underway. ***Copy seen:*** DGS.

54132. *PRECAMBRIAN.* Oceanic Iron Ore. (Precambrian, Oct. 1957. v. 30, no 10, p. 62–65, port.)

Notes claims of the Oceanic Iron Ore of Canada Ltd. west of Ungava Bay and south of Payne River in northern Quebec; also on southwest Baffin. The Ungava properties, explored in 1955–1957, have estimated output of 4,000,000 tons; the Morgan Range and Payne Range orebodies are described. Financing, construction of mine, processing plant, townsite and airport are considered, also possible trans-shipment port in Newfoundland or Greenland, railroad to Payne River, ore markets, and treatment of ore. Company came under direction of Rio Tinto Mining Co. of Canada in May 1956. ***Copy seen:*** DGS.

54133. *PRECAMBRIAN.* A review of Department of Mines and Technical Surveys. (Precambrian, Apr. 1958. v. 31, no. 4, Mining in Canada, p. 23–64, illus., text maps.)

Development and functions of this federal government department are reviewed. Separate articles deal with work of the Survey and Mapping, Mines, and Geographical Branches, the Geological Survey, the Mineral Resources and Explosives Divisions, and relevant activities of the Dominion Observatories. Work underway or planned in the far North is noted throughout, including Operations Mackenzie, Fort George, Pelly, Coppermine, etc.

Natural resources of Kola Peninsula and their development are cited by the secretary of the Murmansk party organization on the 25th anniversary of the Northern Fleet based on Kola Peninsula: fisheries with 5 million cwt. output in 1957 (8.8 million cwt. planned for 1965); apatite ores in Khibiny and activities of the "Apatit" combine; nickel ores and activities of the "Severonikel'" combine

in Monchegorsk, and "Pechenganikel'" in the Pechenga District; aluminum plant in Kandalaksha, iron ores in Olenegorsk, rich cyanite deposits in eastern part of peninsula, etc. Cooperation of the peninsula administration with the Northern Fleet is noted. ***Copy seen:*** DLC.

54148. PROKOF'EV, V. V usloviiakh zapoliar'ia. (Arkhitektura SSSR, 1958, no. 7, p. 3–6, illus.) Text in Russian. ***Title tr.:*** Construction above the Arctic Cirele.

Construction of new towns and reconstruction are briefly discussed in connection with mining and industrial development of the Murmansk region (Severomorskoye, Polyarnyy, Kirovsk, Monchegorsk, Olenegorsk, and others). Shortage of local building materials necessitated construction of new plants for mass production of silicate bricks and blocks, "termozit" and slag-cement blocks. High quality cement was prepared from nephelite waste and diatomite from large local reserves. The long winter season necessitated use of prefabricated reinforced concrete panels, flooring, steps, window and door frames, etc. Construction of roads, utility systems (water, sewer and steam supplies) and public buildings are briefly discussed. ***Copy seen:*** DLC.

54149. PROKOPOVICH, A. A., *and* **I. G. BOL'SHAKOV.** Obogashchenie zhelezistykh kvartsitov na Olenegorskoĭ fabrike. (Gornyĭ zhurnal, May 1958, no. 5, p. 53–55, tables.) 3 refs. Text in Russian. ***Title tr.:*** Concentration of ferrous quartzite at the Olenegorsk plant.

Characteristics of the ore and production processes are described from technological and economic viewpoints, with tabulated data. The plant at Olen'ya (new name for Olenegorsk) in the Khibiny region of Kola Peninsula started operation in 1955 and its annual ore production was 6.6 million tons; that of concentrates 2.8 million tons. Average iron content of the ferrous quartzites was 30.4%. The plant has three main divisions: crushing, concentrating and dehydrating. All intermediate processes are shown schematically on a flow-diagram. ***Copy seen:*** DLC.

54150. PRONIN, A. A. Uspekhi izucheniia geologii i poleznykh iskopaemykh Urala za 40 let i zadachi dal'neĭshikh issledovaniĭ. (Akademiia nauk SSSR. Izvestiia vostochnykh filialov, 1957. no. 10, p. 39–51.) Text in Russian. ***Title tr.:*** Progress of the investigation of the geology and industrial minerals of the Ural during 40 years and tasks of further explorations.

Presents a brief survey of work by Soviet scientists and scientific organizations in study of the stratigraphy, paleontology, tectonics, geomorphology, hydrogeology and in mineral prospecting. Though iron ores remain the basic wealth of the Ural, it has become one of the richest sources of non-ferrous and rare metals and of many other, non-metallic minerals: asbestos, magnetite, talc, graphite, marble, corundum, mica, refractory clays, gypsum, kaolin, dolomite, glauconite, semi-precious stones, etc. Investigations of the Northern Ural by S. G. Boch, V. A. Varsanof'eva, and many others are noted; the importance of the Pechora coal basin for development of the Ural is stressed. Further objectives are outlined in each field of geology and mineralogy. ***Copy seen:*** DLC.

Issledovaniiâ moreĭ SSSR, 1932. vyp. 16, p. 87–102, illus. tables, map.) 2 refs. Text in Russian. Summary in German. ***Title tr.:*** Some data on the hydrological regime of the Mezen' estuary.

Account of investigations conducted in 1928–1930 where this river flows into Mezenskiy Zaliv of the Barents Sea (approx. 66° N. 44° E.) east of the White Sea narrows. Tides and tidal currents were found to be considerable when compared with those of other northern rivers of the region. Temperature and salinity, transparency and color of the water were studied only during the summer; except for temperature they showed great fluctuations, depending on the tides. ***Copy seen:*** DLC.

54156. PRUDHAM, GEORGE. Northern horizons, 1957. (Western miner and oil review, Feb. 1957. v. 30, no. 2, p. 34–36.)

Minister of Mines and Technical Surveys for Canada reviews recent projects of his Department and outlines those scheduled for 1957–58, with emphasis on geological surveys (Keewatin District, Baker Lake region, Pelly River area, Mackenzie District, Queen Elizabeth Islands, etc.). Use of aircraft, helicopters, and expected discoveries of minerals, gas, and oil are mentioned. Topographic surveys are also noted: in Yukon mapping, the northern part is near completion; shoran surveys are concentrated in the Eastern Arctic and the Arctic Islands. ***Copy seen:*** DI.

54157. PRUITT, WILLIAM OBADIAH, 1922– . A high altitude weasel. (Murrelet, Sept.–Dec. 1957. v. 38, no. 3, p. 36.)

Contains record of a frozen and mummified carcass of *Mustela erminea,* found at 15,000 ft. on Mt. McKinley June 20, 1956, by Mr. Randall, member of the Alaskan Alpine Club Expedition. The specimen falls within the range of measurements for *M. e. arctica* and died presumably of starvation.

54158. PRUITT, WILLIAM OBADIAH, 1922– . Observations on the bioclimate of some taiga mammals. (Arctic, 1957. v. 10, no. 3, p. 131–38, graphs, table.) 9 refs.

Reports a study at Fairbanks, Alaska, 1954–56, on the thermal environment of the moss-covered forest floor, the habitat mainly of red-backed voles, shrews, weasels, and red squirrels. Thermistors recorded temperatures at the surface, 6 ft. above, and 3, 6, and 9 in. below. Findings during the snow-free and snow periods are discussed, including stable temperature comparatively warm in winter and cool in summer. Effects of various snow cover thickness on the range and fluctuations of subnivean temperatures are noted. Contrast between the under- and above-snow environments causes the mammals to abandon surface activity when the cover reaches 15–20 cm. depth.

Copy seen: DGS.

54159. PRUITT, WILLIAM OBADIAH, 1922– . *Qali,* a taiga snow formation of ecological importance. (Ecology, Jan. 1958. v. 39, no. 1, p. 169–72, illus.) 5 refs.

A discussion of the ecological importance of *qali,* a Kobuk valley Eskimo word for snow that collects on the trees. Its effect on trees and on movements and vertical migrations of some birds and mammals is discussed. A method for standardizing *qali* observations is also described. ***Copy seen:*** DLC.

54160. PRUITT, WILLIAM OBADIAH, 1922– . Tooth reduction in a tundra shrew. (Journal of mammalogy, Feb. 1957. v. 38, no. 1, p. 121.)

Notes and morphometric data on a skull of *Sorex tundrensis* from Alaska, with the fourth unicuspid (P3/) apparently missing. Several reports on dental anomalies in shrews are mentioned.

Copy seen: DI.

54161. PRUITT, WILLIAM OBADIAH, 1922– , *and* **C. V. LUCIER.** Winter activity of red squirrels in interior Alaska. (Journal of mammalogy, Aug. 1958. v. 39, no. 3, p. 443–44, illus.)

Report on almost daily observations in a white spruce forest near Fairbanks. The squirrels were virtually never active above snow when air temperature fell below −25° F. Similarly they were not active when differences between air and surface-moss temperature was more than 20° F. or more than 30° between air and moss, 9 in. below the surface.

54174. PUT͡SILLO, VERA GEORGIEVNA, *and* **S. I. MIRONOV.** Bitumy Turukhanskogo raĭona. (*In:* Put͡sillo, V. G., *and others*. Nefti i bitumy Sibiri, 1958, p. 103–117, tables, cross-sections.) 4 refs. Text in Russian. ***Title tr.:*** The bitumen of the Turukhansk region.

Reviews in general, the oil-bearing properties of the northern part of this region, which lies between the Taymyr folded zone and north Siberian block masses; and presents analyses of Cambrian and Silurian bituminous matter found in Nizhnyaya-, Podkamennaya-, and Sukhaya-Tunguska River regions. Special attention is given to the Sukhaya Tunguska district, near the mouth of the D'yavol'skaya where Silurian bitumen and bituminous matter were studied in detail. Pertinent data are illustrated (tables). These investigations are said to have established a similarity with Permian oil-bearing deposits of the Anabar massif. Oil-bearing deposits of both these areas are characterized by predominance of petroleum asphalt and tarry particles, and have similar content of oil matter. ***Copy seen:*** DLC.

54175. PUT͡SILLO, VERA GEORGIEVNA, *and others*. Nefti i bitumy devonskikh otlozheniĭ o-va Severnaĭa Zemli͡a, Salekharda i Minusinskoĭ kotloviny. (*In:* Put͡sillo, V. G., *and others*. Nefti i bitumy Sibiri, 1958, p. 145–54, tables.) Text in Russian. *Other authors:* S. I. Mironov *and* S. I. Vorob'eva. ***Title tr.:*** Oil and bitumen of the Devonian deposits in the Severnaya Zemlya Islands, Salekhard, and the Minusinsk trough.

Presents the physical and chemical composition of oil, tar, asphaltenes, and other oily bituminous matter of Severnaya Zemlya, Salekhard, and the Bystryanskaya structure of the Minusinsk trough and evaluates the oil-bearing properties of their Devonian deposits. Analyses of component elements, oil refining, asphalt-tarry particles; acid and ester numbers, saponification, and other properties within each region are analyzed and compared. The Middle Devonian of Severnaya Zemlya and Salekhard, which appear to comprise the oil series, are characterized by low content of sulphur and differ from the Minusinsk region, which are characterized by light naphtha, and by content of sulphurous and (high) nitrogenous compounds. ***Copy seen:*** DLC.

Reports results of prospecting for oil in the Cambrian deposits in the Tolba, Maya, Olenek, Amga, Lena and Tunguska River regions and in Permian deposits in the Khatanga and the Lena-Vilyuy depressions. Various bitumen and bituminous materials such as oil, tar, asphaltenes, benzene, benzoin, chloroform and others were studied, and their chemical analyses, organic and mineralic properties and fractional composition are outlined and data presented. Cambrian bituminous matter of the Siberian platform is divided into two genetic groups: one characterized by high content of greasy fractions and low content of asphaltenes, the other, in contrast, characterized by low oil and high asphaltene content. To the first belong the Maya, Tolba and Olenek bitumens; to the second, the bitumens in Amga, Lena and Tunguska River regions. Bitumens from the Khatanga depression are also analyzed and compared.

54183. R.S.F.S.R. STATISTICHESKOE UPRAVLENIE. Narodnoe khozяĭstvo RSFSR; statisticheskiĭ sbornik. Moskva, Gos. statisticheskoe izd-vo, 1957. 371 p. tables. Text in Russian. ***Title tr.:*** The economy of the R.S.F.S.R.; a statistical handbook.

Contains data to the end of 1955 on population, administrative division, cities, towns, etc., industry, agriculture, transportation, labor, commerce, education, public health, welfare, and urban conditions. The Russian Soviet Federated Socialist Republic includes Karelian, Komi and Yakut A.S.S.R. and Murmansk, Arkhangel'sk, Tyumen', Krasnoyarsk, Magadan and Kamchatka provinces. The data are presented mostly by provinces, and, stressing economic development, are compared with those for 1913, 1928 (pre-five-year-plans), and 1940. For the far North regions (raĭony Kraĭnego Severa) covering 10.5 million km.^{2} with 3.8 million population, basic indexes of development (since 1940) are summarized without geographic breakdown (p. 42–44). List of cities with population exceeding 50 thousand (p. 48–49) includes Arkhangel'sk (258 thousand), Murmansk (168), Noril'sk (92), Yakutsk (63), Petropavlovsk-in-Kamchatka (58) and Magadan (55 thousand). Reindeer increased from 1911.2 thousand in 1940 to 2135.7 in 1953 and decreased to 1988.7 in 1955; with the largest herds in Magadan (over 500 thousand) and Tyumen' (over 400 thousand) provinces. The number of collective farms in the northern provinces reflects the process of consolidation ("ukrupnenie") notable throughout R.S.F.S.R.: 167,291 in 1940; 48,163 in 1956. ***Copy seen:*** DLC.

Relates impressions from two tours of northern Sweden, Finland, and Norway, with descriptions of landscape and brief notes on the Lapps. The Kiruna ore mines were visited. ***Copy seen:*** DLC.

54185. RABKIN, M. I. Ul'traosnovnye porody Anabarskogo shchita. (Leningrad. Nauchno-issledovatel'skiĭ institut geologii Arktiki. Trudy, 1958. t. 80, Sbornik stateĭ po geologii Arktiki, vyp. 5, p. 118–33, illus., tables.) 13 refs. Text in Russian. ***Title tr.:*** Ultrabasic formations of the Anabar shield.

Outlines Archean ultrabasic rocks collected by author and others in the upper Anabar basin (approx. 68°–70° N. 100°–112° E.). Archean deposits are sparsely distributed and are represented by amphibolitic and serpentinized peridotites, amphibolized pyroxenites and amphibolites. Petrographic description for each of these groups is given; mineralogic

characteristics are outlined and chemical analyses presented. The genesis of ultrabasic rocks is discussed.

Contains a taxonomic list of 122 species. The geological history of the Ontario drainage system is outlined and related to the glaciation of the region; the more important waterways are discussed. The fishes are placed in twelve groups depending on the nature of their occurrence in Ontario waters; notes are given on their habitats, range (text maps), etc., including distribution in northern Ontario. ***Copy seen:*** DSI–M.

54188. RADFORTH, NORMAN WILLIAM, 1912– , *and* I. C. MacFARLANE. Correlation of palaeobotanical and engineering studies of muskeg (peat) in Canada. (National Research Council of Canada. Division of Building Research. Research paper no. 35, Aug. 1957, p. 93–97, illus.) 9 refs.

Studies were carried out using the principles of paleobotany to evolve a system of muskeg classification for engineers, based on surface and subsurface characteristics of the organic terrain. Pertinent surface characteristics include vegetative cover and topography; sub-surface characteristics were determined from microscopic examinations and the results interpreted in terms used by engineers. In the application of the system, relevant macroscopic sub-surface characteristics are fibrousness and woodiness of the material. Preliminary engineering studies of the properties of muskeg, employing soil mechanics principles, are being linked to the classification system.—From author's abstract.

54189. RADFORTH, NORMAN WILLIAM, 1912– . Organic terrain organization from the air, altitudes 1,000 to 5,000 feet. Ottawa, Queen's Printer, Feb. 1958. 23 p. 21 p. of illus., tables. (Canada. Defence Research Board. Directorate of Physical Research. Handbook no. 2.) 9 refs.

Provides mechanics by which interpretation from the air can be extended beyond the limit (1,000 ft.) covered in No. 47495, on the basis of natural botanical relations and topography. Selection and analysis of terrain pattern are discussed, with summary tables and representative photos. Six new form values or primary patterns, as observed from altitudes of 1,000 to 5,000 ft., are named, described, and illustrated. Three secondary patterns, or sub-types are suggested. The air form is explained in terms of ground character, relating the text to plates and to summary tables. Access problems are analyzed by applying inspection from 5,000 ft. altitude, also illustrating conditions with air photos. New terms are defined. ***Copy seen:*** DGS.

54190. RADFORTH, NORMAN WILLIAM, 1912– . Palaeobotanical evaluation of fossil wood in Onakawana lignites. (Royal Society of Canada. Transactions, June 1958. v. 52, ser. 3, sect. 5, p. 41–53, illus., diagr.) 6 refs.

Discusses investigations of fossil samples of coniferous wood, probably Cretaceous, taken from lignites at Onakawana on the Abitibi River, northern Ontario. Specimens of a large trunk or branch segment, a small branch segment with pith, and a bristle-type fossil occurring frequently in association with the woody fragments are described, and results of analyses are given. The wood specimens

511326—60——60

are assigned to the genus *Cupressinoxylon* Goppert, with new species, *Cupressinoxylon bannani* Radforth, sp. nov., proposed for the trunk and branch segment, and *Cupressinoxylon lignomedullosum* Radforth, sp. nov., for the small branch segment. New genus and species are proposed for the fossil fungus *Onakawananus* Radforth, gen. nov., and *Onakawananus varitas* Radforth, sp. nov.

p. 267–69.) Text in Russian. ***Title tr.:*** Conference on the geology and mineral resources of Krasnoyarskiy Kray.

Outlines a conference held in Moscow, Feb. 3–6, 1958 under auspices of Moscow State University. Over 350 scientists from 57 organizations took part. The principal speakers and their topics are mentioned. In the plenary session, opened by G. P. Gorshkov, L. A. Ragozin reported on the Yenisey expedition carried out by Moscow University, and S. V. Levchenko on the mineral resources and ways of their development in Krasnoyarskiy Kray. The conference met in four sections: Paleozoic and Precambrian, Mesozoic and Triassic, Quaternary and Tectonics, and mineral resources. In the first, and most numerous section, presided over by V. E. Khain, several papers were presented on the geology of northern part of Krasnoyarskiy Kray by the representatives of the Institute of Geology of the Arctic: N. N. Urvant͡sev, ÍA. N. Polkin, N. A. Sîgaev, B. V. Tkachenko, I. P. Atlasov. Despite the great achievements to date, exploration of the Archeozoic and Proterozoic eras is still insufficient. The mineral resources section chaired by A. V. Milovskiĭ, heard several reports on mineralization and occurrence of rare-earth minerals (ÍÛ. A. Burmin, ÍÛ. D. Gushchin, L. B. Zubkov, E. M. Épshteĭn.). K. V. Radugin presented a new method for prospecting of blind ore bodies, and A. V. Milanovskiĭ a paper on processes of progressive metamorphism in rare-earth minerals and micaceous pegmatites. S. P. Mikut͡skiĭ, R. V. Chaĭkovskaîa and T. K. Bazhenova reported on the petroliferous exploration in the western part of the Siberian platform. Further exploration for coal, metals and oil and the need for construction of a power station on the Yenisey and improvement of transportation were stressed.

54206. RAILSBACK, H. E., *and* **Q. L. MORRIS.** Low temperature properties of 80% cispolybutadiene. (Rubber world, Apr. 1958. v. 138, no. 1, p. 75–80, 84, graphs, tables.)

Presents results of tests on rubber with a Mooney viscosity (ML–4 at 212° F.) of 18; the configuration was 78.6% *cis*, 16.6% *trans*, and 4.8% vinyl. Tests included Gehman freeze point, rate of retraction, cold compression set, resilience and Shore hardness; properties were determined at temperatures to −115° C. and conditioning up to 70 hrs. The polymer gave a Gehman f.p. of −97° C. and less tendency to crystallize than natural rubber or emulsion polybutadiene; it gave softer and more elastic stocks at low temperature than did any of the controls, and displayed stress-strain properties similar to those of emulsion polymerized polybutadiene and hysteresis properties equivalent to those of natural rubber. ***Copy seen:*** DLC.

54207. RAINEY, FROELICH GLADSTONE, 1907– . Arkheologiîa amerikanskoĭ Arktiki. (Sovetskaîa ėtnografiîa, 1958, no. 2, p. 54–62.) 22 refs. Text in Russian. Paper read at the Institute of Ethnography of the Academy of Sciences, U.S.S.R., in July 1957. ***Title tr.:*** Archeology of the American Arctic.

Reviews major archeological finds of the last 30 years. Advantages are stressed of American-Russian collaboration for solution of the Eskimo origin problem, for better interpretation of historical sequence and proper dating of different Eskimo cultures. The Bering Sea excavations of the 1930's resulting in recognition of the Okvik, Old Bering Sea and Punuk culture stages, the discovery of the Point Hope Ipiutak site in 1939, further Ipiutak and Dorset finds in Alaska and Canada and, finally, in 1948, the discovery of the mesolithic Denbigh flint complex are sketched. G. F. Debet͡s' opinion, based on his study of the New York Natural History Museum material, that Ipiutak skeletal remains belong to the Yukaghir physical

type while the Old Bering Sea skeletons show pure Eskimo traits, may change the present-day assumption of a racial and linguistic affinity between Paleo-Eskimos (Ipiutak, Dorset) and Neo-Eskimos (Old Bering Sea, Punuk). ***Copy seen:*** DLC.

Text in German. Summaries in English and French. ***Title tr.:*** Studies of talus slopes in Lapland and in Spitsbergen.

Results of author's investigations 1952–1957 in the valley of Kärkevagge, extreme northwest Sweden (approx. 68°20′ N. 18°10′ E.), and at Bjonahamn, Tempelberg in the Tempelfjorden region, Vestspitsbergen (78°20′ N. 16°30′ E.) in 1954. About 70 rock falls were observed, or traced and measured at Kärkevagge; most occurred in May and June. Transport and removal processes are discussed; removal of debris seems to be unimportant. In the Tempelfjorden area, talus slopes are generally larger and thicker than in Lapland. The talus cones at Bjonahamn were compared with photographs of 1908, 1924, and 1936; no noteworthy transport of debris has occurred in the central and distal parts of the cones since 1908, contrary to the opinion that talus in the Arctic is transported relatively fast, especially through creep and solifluction. The talus slopes investigated probably accumulated mainly at the melting off of the inland ice or shortly afterward, and thereafter were supplied with rock waste at a slower rate during the postglacial period.—From English summary. ***Copy seen:*** DGS.

Text in Norwegian. ***Title tr.:*** The main problem of the Norwegian Forestry Association is to further increased forest production.

Discussion of forestry problems including reference to north Norway. Forests should be increased within the next century by cultivation on all areas with suitable soil and climate.

Copy seen: DA.

54215. RASMUSSEN, BIRGER, 1907– . Exploitation and protection of the East Greenland seal herds. (Norsk hvalfangst-tidende, Feb. 1957, årg. 46, nr. 2, p. 45–59, illus., map, diagrs., table.) 9 refs. Text in Norwegian and English.

Deals in detail with the biology, the feeding, breeding and migration habits, etc. of two species caught commercially in the pack ice east of Greenland: harp seal (*Phoca groenlandica*) and hooded seal (*Cystophora cristata*). Tagging and age determination (based on structural variations in teeth) are discussed. Data are considered and graphically presented on age distribution and composition of catches, growth rate, etc. Sealing in the area and protective measures are reviewed. Death rate among pups (probably 50%) and their commercial importance show that to maintain sealing at a profitable level the sexually mature population must be protected. Norwegian regulations exist and Norway alone sealed in the Jan Mayen area till 1955, when the Russians began and in 1956 had ten vessels operating there (Norwegians: 44). No international agreement covers this or the Denmark Strait sealing grounds.

54216. RASMUSSEN, BIRGER, 1907– . Om fløytelinefisket i Holstensborgdjupet, Vest-Grønland, 1953. (Fiskets gang, Apr. 1, 8, 1954. årg. 40, nr. 13, p. 160–62, nr. 14, p. 174–77, illus., diagrs., tables.) Text in Norwegian. ***Title tr.:*** On floatline fishing in the Holsteinsborg deep, West Greenland, 1953.

The Norwegian fishing fleet in West Greenland at the end of May (a month earlier than usual) found abundant catch of good quality. Measured temperatures at different depths were relatively much higher than in 1952, and the warmer waters contained abundant food. By August good cod fishing was confined largely to the Holsteinsborg deep. Studies there indicate increased catch with increased depth and decreased temperature to 128 m. depth, below which catch diminished.

way. Fiskeridirektoratet. Årsberetning vedkommende Norges fiskerier 1949, *pub.* 1950, no. 7, p. 110–27, illus.) Text in Norwegian. ***Title tr.:*** The Svalbard-Greenland cruise 1949.

Chronological account of a study cruise over arctic fishing banks, with information on water temperatures and fishing conditions at various depths off Bjørnøya, Spitsbergen, Jan Mayen, and East and West Greenland. The strong current of warm Atlantic water observed in the Spitsbergen region may have disturbed the polar pack ice and caused its drift toward Greenland, where ice conditions in 1949 were unusually severe. The cooperation of trawlers, freighters, hydrology investigators, and shore depots in the Greenland fishery is described. The recently developed fishing bases near Faeringerhavn provide means of increasing both quantity and quality of catch. ***Copy seen:*** DLC.

Issledovaniia moreĭ SSSR, 1931. vyp. 13, p. 5–103, illus., tables, maps.) 7 refs. Text in Russian. Summary in German. ***Title tr.:*** The hydrology of the East Siberian Sea.

Account of hydrological observations made in the summer 1929 from the icebreaker *Litke* on its voyage to the Vrangel Island. Following an outline of the itinerary and working methods, four profiles are presented with conditions of their temperature and salinity, oxygen content and reaction. In addition, conditions at a number of scattered stations are discussed. The earlier-

assumed presence of a cold and warm current is confirmed and worked out in detail. Salinity varies between 1.58°/₀₀ and 35.19°/₀₀; aeration was found to be active; high alkalinity was noted on the surface of the ice. ***Copy seen:*** DLC.

54228. RATMANOV, GEORGIĬ EFIMOVICH, 1900– . K voprosu o gidrologicheskom rezhime Onezhskikh prolivov Belogo morîa. (Leningrad. Gosudarstvennyĭ gidrologicheskiĭ institut. Issledovaniîa moreĭ SSSR, 1928. vyp. 9, p. 71–96, illus., tables, map.) Text in Russian. Summary in German. ***Title tr.:*** The problem of the hydrological regime of the Onega Straits of the White Sea.

Account of investigations conducted in 1925 and 1926 in the eastern and western approaches to Onezhskiĭ Zaliv and in Salma Rebolda (now Anzerskaya), the strait between Anzerskiy and Solovetskiy Islands in the mouth of the Bay. The outflow of water from Onega Bay was found to run mainly through the western part of the western strait; its depth does not exceed 25 m. and its character resembles that of the water in the bay. Currents of the area are also discussed. ***Copy seen:*** DLC.

54229. RATMANOV, GEORGIĬ EFIMOVICH, 1900– . K voprosu o gidrologicheskom rezhime "Sukhogo morîa". (Leningrad. Gosudarstvennyĭ gidrologicheskiĭ institut. Issledovaniîa moreĭ SSSR, 1928. vyp. 6, p. 73–80, maps.) Text in Russian. Summary in German. ***Title tr.:*** The problem of the hydrological regime of the "Dry Sea."

Account of investigations conducted in this, the northeastern part of the White Sea, during 1925–1926. The temperature and salinity regimen were determined. The southern part of the "Dry Sea" showed a low salinity due to the fresh water coming down the Dvina River. Mixing of water masses was good. Currents were also investigated. ***Copy seen:*** DLC.

54230. RATMANOV, GEORGIĬ EFIMOVICH, 1900– . K voprosu o vodoobmene cherez Beringov proliv. (Leningrad. Gosudarstvennyĭ gidrologicheskiĭ institut. Issledovaniîa moreĭ SSSR, 1937. vyp. 25, p. 119–35, illus., tables, maps.) 8 refs. Text in Russian. Summary in English. ***Title tr.:*** The problem of water exchange through the Bering Strait.

Following a geographical outline of the area, the author presents the results of his investigations in 1932 and 1933 on 23 hydrological stations. In addition to current velocities and direction, salinity, temperature and other elements are discussed. The almost exclusive direction of the current was found to be to north, carrying relatively warm Pacific water through the Strait. The role of atmospheric pressure, and winds in this current is also evaluated. ***Copy seen:*** DLC.

54231. RATNER, BENJAMIN. Upper-air climatology of the United States. Washington, D.C., U.S. Govt. Print. Off., 1957–1958. 2 pt.: 199, 140 p. tables, maps, diagrs. (U.S. Weather Bureau. Technical paper no. 32.) Refs.

Part 1, *Averages for isobaric surfaces: height, temperature, humidity, and density,* presents climatological statistics of the upper air, including tables for 12 stations in Alaska, based on 8–10-year records. Data up to the 50 mb. surface generally are shown.

Part 2, *Extremes and standard deviations of average heights and temperatures,* presents data for eight pressure surfaces, ranging from 950 to 100 mb. for each month; charts (Jan., April, July, Oct.), for seven pressure surfaces, showing height contours and isotherms, with standard deviations and extreme values for each station. Absolute extremes of height, temperature, and density are also tabulated. ***Copy seen:*** DWB.

54236. RAUSCH, DONALD O., 1902– . Ice tunnel, TUTO area, Greenland, 1956. Wilmette, Ill., Feb. 1958. 34 p. illus., diagrs., tables. (*In:* U.S. Army. Corps of Engineers. Greenland ice cap research program, 1955–56, v. 2. SIPRE technical report 44.) 10 refs.

Interim report on summer 1956 field work by a four-man party, to study feasibility of excavating rooms and tunnels under ice. At a site approx. one mile from Camp TUTO, a 2500 cu. ft. room, 10–25 ft. height and 3,600 sq. ft. floor space, was excavated. The extension of the tunnel (started 1955) indicated that an overburden depth (approx. 160 ft.) had been reached at which hand methods of tunnel driving were not practical; explosives or automatic coal mining machinery would be needed. Excessive deformation did not occur at the overburden depth reached in the extension.—From author's summary.

Summary in English. ***Title tr.:*** Hydraulic size of the diamond and of its main associated minerals.

Reports results of a study of the speed at which a diamond sinks in water at rest, and similarly for kimberlite, quartz, pyrope, ilmenite, magnetite and almadite. The study was carried out in the Land Hydrology laboratory at Leningrad University by a group of scientists working with the Central Expedition of All-Union Geologic Institute, in the search for diamonds in Yakutia. Data for various sizes of minerals are tabulated (p. 135), illustrated by diagrams and discussed. The hydraulic size of the diamond does not correspond with its specific gravity (3.5), but is near that of heavy minerals with specific gravity 4–4.5. The significance of this finding for understanding the distribution of diamonds in alluvial deposits, is stressed. ***Copy seen:*** DLC.

54254. REED, JOHN CALVIN, 1905– . Exploration of Naval Petroleum Reserve No. 4 and adjacent areas Northern Alaska, 1944–53; part 1, history of the exploration. Washington, D.C., U.S. Govt. Print. Office, 1958. 192 p. illus., maps incl. 2 fold. and diagr. in pocket. (U.S. Geological Survey. Professional paper no. 301.) 6 refs.

First of five reports on exploration carried out by the Navy Dept. and the Geological Survey in the region 68°–71° N. 151°–162° W. Its purpose was to ascertain petroleum possibilities in this 70,000 sq. mi. area. Topographic, climatic, and other natural conditions are described and previous exploration reviewed. For each of the ten years in turn, the planning, operations, and results are reported. The operations included transportation, camp, road, airfield construction, surveys, drilling, etc. Work of the geophysical and geological field parties, and progress of air photography and mapping are stated. Operations of other agencies in the area are also reported year by year. Information is given throughout on vehicles and other equipment, their performance, maintenance, etc., on permafrost and environmental conditions, personnel, camp facilities, the Arctic Research Laboratory, on natives and their employment, on geologic and geographic features, especially streams, etc. This scattered information is made accessible through index appended; and various aspects of the operations and terrain are illustrated in some hundred photographs. In the useful summary which is added (p. 169–83), nine oil/gas fields are characterized, and the program as a whole is appraised as a pilot in organization and conduct of large-scale field operations under arctic conditions. ***Copy seen:*** DGS.

54255. REED, JOHN CALVIN, 1905– . The United States turns north. (Geographical review, July 1958. v. 48, no. 3, p. 321–35, 8 illus. incl. text map.)

Survey of problems in future development of the Arctic, mainly pertaining to living, transportation and communications. Notes unanswered questions about man, animals, plants, land and sea surface, the geological framework, the weather, and construction engineering, etc. on permafrost. Describes recent Canadian and American scientific, economic and military expansion toward the North, especially during the IGY. Private organizations, civilian and military agencies of the United States Government supporting arctic research are mentioned. IGY projects at Thule, Fort Churchill, Point Barrow, McCall Glacier in the eastern Brooks Range, and drifting stations A and B (Fletcher's Ice Island or T–3) are described. Some 50 U.S. stations conduct research in solar activity, cosmic rays, ionospheric physics, aurora and airglow, geomagnetism, meteorology, glaciology, oceanography, seismology and gravity. ***Copy seen:*** DGS.

54257. REED, JOHN CALVIN, 1930– . Vegetation studies for military purposes. (Military engineer, Nov.–Dec. 1957. v. 49, no. 332, p. 415–19, illus., tables, maps.)

Outlines objectives and requirements of tactical vegetation maps in military planning, and describes terrain studies by the 535th Engineer Detachment of the

Army Map Service in the Anchorage-Matanuska Valley area, Alaska (1955), and in California (1956). A tactical classification system of vegetation is presented and its adaptation to aerial photographs is illustrated and described. Aids and methods in map compilation are suggested; sampling and description of vegetation units are discussed. A section of the Alaskan map is shown together with its legend, which provides the data on vegetation type, forest density, tree species and heights, ground visibility, and effect on cross-country movement corresponding to the map unit.

54259. REED, RICHARD J. Arctic synoptic analysis. (*In:* Wilson, C. V. Contributions to the study of the arctic circulation, 1958. p. 48–59, maps, diagrs.) 3 refs.

Differences between arctic and middle-latitude analysis are of degree rather than of kind: in secondary problems, e.g., disagreement between meteorologists' analyses, existence of true fronts in the Arctic, and the so-called "arctic front." Discussion of these problems is supported by synoptic charts, an overall sketch map of cyclone behavior in the Arctic, and a cross-section of a cold front zone.

54260. REED, RICHARD J. Arctic weather analysis. (*In:* Polar Atmosphere Symposium, Oslo, 1956. v. 1, *pub.* 1958. p. 124–36, graphs.)

No special procedure or techniques are used in arctic weather analysis. Inadequacies of some of the present methods employed in synoptic meteorology and in the coverage of the present arctic weather network are discussed. Although station coverage is not adequate over the entire Arctic, test results suggest that numerical prediction can be carried out with reasonable success in areas where station density is comparable to that in the Canadian Archipelago. ***Copy seen:*** DLC.

54261. REED, RICHARD J. A baroclinic graphical prediction model. (*In:* Wilson, C. V. Contributions to the study of the arctic circulation, 1958. p. 69–76, diagrs.) 2 refs.

Explains the elements of graphical prediction, without mathematical detail. This method integrates the fundamental equations graphically instead of numerically. Model atmospheres are used. Baroclinic models are more complex than barotropic, but a 500 mb. (barotropic) forecast is a prerequisite to a surface or 1000 mb. (baroclinic) prognosis, considered here. Graphical prediction methods combine some advantages of both conventional techniques and the purely numerical (electronic) forecasts, based upon the dynamical equations, as described by Godson (q.v.), and may prove satisfactory until the numerical method shows superiority. ***Copy seen:*** CaMAI.

54262. REED, RICHARD J. Cold polar vortices. (*In:* Wilson, C. V. Contributions to the study of the arctic circulation, 1958. p. 60–68, maps, diagr., table.) 6 refs.

Informal discussion of cold polar vortices or cyclones, commonly present in the middle or upper troposphere, with emphasis on their climatology, structure, and mechanics; also comment on problem of forecasting movement of these systems. Impressions are stated of cold lows common throughout the Arctic during the cold season; vigorous polar lows occurring frequently during the summer, centered closer to the pole than in winter; at 500 mb., well-developed, cold season lows with central temperatures of −45° to −50° C. and a central height of 16,000 ft.; corresponding warm season figures: −30° C., and 17,000 ft.; polar, compared with middle latitude, lows have long life spans. A schematic diagram shows some structural features of these vortices. Their origin and maintenance are considered (from surface and 500-mb. - level charts). The Fjörtoft method of graphical forecasting (test results tabulated) is considered fairly promising.

Copy seen: CaMAI.

54263. REED, RICHARD J., *and* **W. G. TANK.** Miscellaneous studies of polar vortices. Seattle, May 1956. iii, 21 p. diagrs., maps, tables. (Washington.

State. University. Dept. of Meteorology and Climatology. Scientific report no. 1; Occasional report no. 4, Arctic meteorology-climatology.) 13 refs. The research was sponsored by the Geophysics Research Directorate of the Air Force Cambridge Research Center, Air Research and Development Command, under Contract no. 19(604)–1298.

Part 1 is a case study of factors contributing to the deepening of a polar low located over northern Canada Dec. 23–28, 1953. Rising motion was mainly responsible for the pronounced cooling which occurred during its most rapid intensification, the kinetic energy released was brought about in a manner somewhat different from that in mid-latitude cyclones. Pt. 2 contains measurements of vertical velocities over a large area of the North American Arctic and sub-Arctic during ten consecutive synoptic periods covering the time of the case study. The absolute values of these vertical velocities are mapped for each of the synoptic periods. An estimate of the large-scale vertical eddy flux of sensible heat at the 700 mb. level is made from temperature and vertical velocity measurements. The results suggest that the mean vertical eddy flux of heat is less at high than at middle latitudes. In pt. 3, a comparison is made of the temperature-dew point depression in closed lows, in high and low latitudes. No significant difference was found between lows in different geographical areas.

Text in Russian. ***Title tr.:*** Preservation of weathered earth and development of relief on the right bank of the middle course of the Lena River.

Presents field observations on weathering in a comparison of roles of weathering and erosion in the development of relief in the Lena basin between its right tributaries Tuolba and Namana. Three stages of relief, caused by variety of surface rocks and the effects of erosion and weathering, are mainly dealt with. Cambrian carbonaceous rocks predominate in this region; they consist of (1) low level of dolomites, limestones and marls, which lie almost horizontal and have a gentle configuration; these represent an erosion surface modeled by a dense net of rivers, developed in the late Quaternary; (2) the plains above, with an older relief surface, formed in the beginning of the Triassic period and not significantly affected by the later cycle of erosion; (3) the most ancient surface, persisting in small spots on the watersheds, is of Jurassic origin and consists of lime-containing conglomerates. In contrast with the two lower erosion surfaces, these spots are typified by weathering as the dominant factor; erosion plays only a secondary role. Insufficient denudation has preserved here the oldest, Jurassic,

relief. A geomorphic map, at scale 1:1,000,000 is included.

(Journal of embryology and experimental morphology, Mar. 1958. v. 6, pt. 1, p. 171–77, illus.) 5 refs. Text in French. Summary in English. ***Title tr.:*** *In vitro* physiology of chick embryo heart after freezing to very low temperature.

A study of survival of whole heart and of pieces of it (in tissue culture) following freezing to temperatures as low as −196° C. Glycerol was found to have a protective value, with an optimum at 30% concentration. Rapid thawing was also essential for survival.

Copy seen: DNLM.

54290. REY, LOUIS R. Studies on the action of liquid nitrogen on cultures *in vitro* of fibroblasts. (Royal Society of London. Proceedings, 1957. ser. B, v. 147, no. 929, p. 460–66, illus.) 7 refs.

Fragments of living tissue, usually from chick embryo heart, rapidly frozen, stored in liquid N, then thawed, showed no surviving elements when cultured *in vitro*. Similar tissue when impregnated in glycerine-saline prior to freezing remained viable, with a maximum survival for 25–30% glycerol. Problems of cold injury are discussed on the basis of these observations. ***Copy seen:*** DNLM.

Studies of deformation in foundations and columns due to ground swelling are described in detail, with emphasis on ground composition (sand, sandy-loam, argillaceous soil, clay, etc.) and moisture absorption. Influence of thermal conditions upon the location of wall deformations (cracks) is analyzed. The depth of freezing is discussed in respect to the relative location of insulated and non-insulated ground. Arrangement of open drainage trenches and insulating ground cover (gravel, slag, peat, etc.) around the building are outlined as control measures for uniform and reduced freezing. Quality of material and workmanship is stressed as a factor in stable foundation construction. Separation of the foundation wall from the ground by tar paper, greasing or oiling, is recommended to prevent wall adfreezing and to permit sliding of the ground along the wall without lifting it. Standard regulations for safe construction should be developed, providing for evaluation of local conditions in respect to ground swelling, moisture content of the ground before freezing, and severity of winter. ***Copy seen:*** DLC.

Interview with N. Khûkin, deputy-chief of the Kolyma Administration of the Hydrometeorological Service: 11 stations in the Kolyma basin area are to make observations during the IGY., one of them (near Oymyakon) 2,040 m. above

sea level on the watershed between the Indigirka and rivers emptying into the Okhotsk Sea. Photo shows station under construction. ***Copy seen:*** DLC.

54298. RÎABOV, ÎU. Zolotaîa vetochka. (Ogonëk, July 1957. god 35, no. 28, p. 30, illus.) Text in Russian. ***Title tr.:*** The golden twig.

In 1956, many gold nuggets were found in the North, the largest weighed 2,126 gm. A special device for picking nuggets out of ore is constructed by the Energetic Laboratory of Dal'stroĭ (?Dal'nevostochnyĭ stroitel'nyĭ trest—Far Eastern Construction Trust), and 30 nuggets were recently found in the Kolyma gold fields. Photo shows a nugget in the form of a twig. ***Copy seen:*** DLC.

54299. RÎABOV, VIKTOR VASIL'EVICH. Okhota i okhotnich'e khozîaĭstvo v SSSR. (Okhotnich'i prostory, 1957. kniga 8, p. 356–74, tables.) Refs. Text in Russian. ***Title tr.:*** Hunting and the hunting industry in the U.S.S.R.

Over 120 commercial animals, including 43 valuable fur-bearers, and some 200 commercial birds occur in the U.S.S.R. and provide a firm basis for the hunting industry. The game resources, considerably depleted by rapacious hunting in pre-Revolutionary times, are recovering due to measures of protection and control adopted by the Soviet government. Soviet hunting societies, hunting farms, sanctuaries and preserves, organs of the hunting administration, scientific institutes and their functions are outlined. Game laws and regulations, measures for the recovery of game resources and acclimatization of valuable animals, for combating poachers and predatory animals are indicated. Progress in collective hunting methods and in dog breeding is discussed with critical comment on shortcomings in several fields of the hunting industry. Liquidation of the All-Union hunting society in 1933, lack of a hunting society in the R.S.F.S.R., and of an All-Union administration of the hunting industry are deplored. Failures are noted in certain acclimatization experiments and in the struggle against wolf predation. Although 40–50,000 wolves are killed annually in the U.S.S.R., their bands are estimated at 100–130,000 head, and their damage amounts to 430–480 million rubles a year, which is equivalent to the total income of the Soviet fur trade. The situation, needs and prospects of hunting in northern and arctic areas are mentioned incidentally throughout.

54303. RICH, EDWIN ERNEST, 1904– , *Editor.* Moose Fort journals, 1783–85. Edited by E. E. Rich, assisted by A. M. Johnson. With an introduction by G. P. de T. Glazebrook. London, Hudson's Bay Record Society, 1954. xxx, 392 p. 3 fold. maps. (Hudson's Bay Record Society. Publications, 17.)

Presents day-to-day record of weather and activities at the Hudson's Bay Co. trading post near the mouth of Moose River at the foot of James Bay. It served as a seaport: trade goods from England and furs from the interior moving in and out in the short open season for sailing vessels. It was one of the Company's two main trading centers (each with subsidiaries) in the area and the journals record extensive traffic with the interior as well as with local Indians. Procurement of game, fish, firewood, post and boat building and repair, movements, health, etc. of Company personnel, transactions with Indians, communication with the Albany post, etc. comprise the daily record kept by John Thomas, chief officer at Moose Fort in this period. Appended are: correspondence between Moose and subsidiary posts; notes on Company posts (six) in the area and their main personnel; standards of trade: value of trade goods and of furs, etc., expressed in beaver skins. Introduction dealing with historical and economic aspects of Moose Fort is followed by list of its personnel. Reviewed by J. W. Anderson in *Beaver,* Spring 1955, Outfit 285, p. 40–41. ***Copy seen:*** DLC.

Comments, by a director of the Hudson Bay Route Association, on ice conditions, development at Churchill, and port traffic during summer 1956. Ice conditions were severe with heavy ice at the eastern end of the Strait as late as July 21. Present ice reporting methods for shipping needs are criticized and new procedures suggested. Extension of the port's dock facilities is recommended. The port closed its season on Oct. 7, setting a new record for grain movement at over 16 million bushels.

54308. RIGG, GEORGE BURTON, 1872– . Comparison of the development of some sphagnum bogs of the Atlantic Coast, the Interior, and the Pacific Coast. (American journal of botany, Jan. 1940. v. 27, no. 1, p. 1–14, 5 illus.) 43 refs.

Contains descriptions of specific examples from each of the three regions. The development of bogs is inferred from their present vegetation, their strata and the materials on which they rest. Raised sphagnum bogs and flat sphagnum bogs occur in Southeast Alaska and along the Alaska coast as far west as the Shumagin Islands. Northern species on the Pacific coast are found farther south in sphagnum bogs than in other habitats except on mountains. ***Copy seen:*** DLC.

54309. RIGG, GEORGE BURTON, 1872– . Growth of trees in sphagnum. (Botanical gazette, Apr. 1918. v. 65, no. 4, p. 359–62, 2 tables.)

Based on data from the Puget Sound region and Alaska, where some conifers are found in sphagnum. Lodge pole pine, Alaska cedar (*Chamaecyparis nootkatensis*), and Sitka spruce are the most common, and they grow poorly in sphagnum. Along the south coast of the Alaska Peninsula, deciduous trees and shrubs are often found in sphagnum (usually stunted and often prostrate) e.g., paper birch (*Betula papyrifera alaskana*), peatbog birch, late alder (*Alnus sinuata*), and net-veined willow (*Salix reticulata*). ***Copy seen:*** DLC.

54310. RIGG, GEORGE BURTON, 1872– . Notes on the flora of some Alaskan sphagnum bogs. (Plant world, June 1914. v. 17, no. 6, p. 167–82, 3 illus.) 13 refs.

Sphagnum bogs along the seashore from Cape Spencer to the Shumagin Islands were examined in summer 1913. All were comparatively thin deposits over rocks and many are occasional patches within tundras, e.g., at Yakutat, Dixon Harbor, Snug Harbor; others are bordered by coniferous forest (e.g., Cordova), while still others occur in forestless areas (e.g., Three Saints Bay, Mitrofania Bay, Unga Island, Sand Point). Eleven of the more typical plants are listed; *Empetrum nigrum* is the most characteristic both in bogs and elsewhere in xerophytic habitats. ***Copy seen:*** DLC.

54311. RIGG, GEORGE BURTON, 1872– . Some sphagnum bogs of the North Pacific coast of America. (Ecology, July 1925. v. 6, no. 3, p. 260–78, plate 4.) 27 refs.

Reports study of 78 bogs, from Coos Bay to Shumagin Island, eleven in Alaska. Besides *Sphagnum*, their most characteristic plants are *Oxycoccus oxycoccus* and *Drosera rotundifolia*. The bogs vary in depth from one to over 30 ft.; those in Alaska are shallow, and rest on rocks. Physiological conditions in bogs exercise a selective influence on their flora. ***Copy seen:*** DLC.

54312. RIGSBY, GEORGE P. Study of ice fabrics, Thule area, Greenland. Wilmette, Ill., Apr. 1955. 8 p. illus., diagrs. (*In:* U.S. Army. Corps of Engineers. Greenland ice cap research program, 1954. v. 1, *pub.* 1957.) SIPRE report 26.

Crystal fabric studies were made on glacier ice taken from 11 locations on the Nuna Ramp, approx. 34 mi. northeast of Thule, and three locations on the Moltke Glacier, approx. 15 mi. east of Thule (map). Field work was carried out June 23–Aug. 25, 1954, by a two-man party. Fabric diagrams obtained are shown. Ice appears to be very sensitive to shearing forces. The strength of the pattern appears to be more or less proportional to the strength of the shearing forces, imposed on the ice. Strong shearing forces seem to produce small crystals, with strong preferred orientations, while high temperatures tend to produce larger crystals.—From author's abstract. ***Copy seen:*** CaMAI.

54313. RIKHTER, GAVRIIL DMITRIEVICH, 1889– . Ozera zapadno-sibirskoĭ nizmennosti. (Priroda, Sept. 1957. no. 9, p. 95–98, 3 illus., text map.) 6 refs. Text in Russian. ***Title tr.:*** Lakes of the West Siberian lowland.

Contains a scheme (text map in scale 1 : 1,000,000) of lake distribution in the large depression between the Ob' and Yenisey Rivers, and from 58° N. to the

Arctic Ocean. The greatest concentration of lakes is in the northern low section from the Arctic Circle to 70° N. also in the central (60°–63° N.) and southern (54°–56° N.) parts. Some regularities are shown in distribution and forms of lakes: in some regions (southeastern) they trend in a northeasterly direction, in others they are grouped in river valleys and lowlands or on the watersheds. The lake forms are variable: round, oblong, cleft, etc. Eight regional subdivisions are shown on the scheme and their characteristics noted in the text.

54319. RINK, HINRICH JOHANNES, 1819–1893. Beretning om en inspektionsreise til Grønland i sommeren 1872. (Grønlandske Selskab. Skrifter, v. 8, 1955. p. 45–93, illus.) Text in Danish. ***Title tr.:*** Report on an inspection trip to Greenland in the summer of 1872.

Describes the journey in detail, and opinions on various aspects of life in Greenland. Rink arrived in Godthåb on May 26, visited about ten places in the northern districts and departed on July 27. He found conditions unsatisfactory and attributed this to disturbance of the traditional way of life and loss of self-respect among the Eskimos. He advocates more extensive use of native materials and resources in building, heating, foodstuffs and the employment of native personnel in administration and trade. The founding of new settlements is proposed, not more trading stations,

but a natural spreading of the population to utilize the sealing and hunting grounds. Money and range of imported goods are discussed: credit notes should be retained and coinage introduced only as small change. The medical service (poor) and other features of the settlements are also dealt with. Rink's own sketches are reproduced among the illus.

Attention is directed to the value of fall observations. In Finland, birds' southward migrations begin as early as June for certain species, e.g., male eiders, and last until December. Scandinavian and arctic birds move in mixed or pure flocks depending on species. Little investigation has been made of faunal composition at various times of year, migration and circulation within the country, and adaptability and habits of non-migratory species. ***Copy seen:*** DLC

54321. RISTIMÄKI, TOINI. Kääpiöviljelmien miestyövoiman käyttö; maaseudun työvoiman tutkimuksia IV. Helsinki, 1955. 105 p. tables, graphs. (Acta forestalia fennica, 63, no. 4.) 54 refs. Text in Finnish. Summary in English. ***Title tr.:*** Use of manpower on dwarf farms; rural labor force studies IV.

Deals with labor on Finnish farms with less than 5 hectares of land under the plow. The large number of such, so-called dwarf, farms is due to agricultural policy in which abolition of tenant farming and agricultural colonization are factors. The nature and activity of this labor force in eastern and northern Finland differ from those in the south, due to differences in economic structure. Income, effectiveness of work, seasonal labor, unemployment, and relief work are related to farm size, intensity of farming, and regional conditions.

(Acta forestalia fennica, 63, no. 6.) 21 refs. Text in Finnish. Summary in English. *Other authors:* S. Väänänen, *and* L. Heikinheimo. ***Title tr.:*** Distribution by industry and unemployment of the manpower in rural districts; rural labor force studies VI.

The input of labor in Finland is represented by the work unit, in percent of the total activity of the resident male population. Input is analyzed in five categories: agriculture, forestry, urban occupations, construction, and unemployment and the data are tabulated (p. 63–70) regionally, the labor "districts" comprising adjoining communes where labor division is similar. The most important of the 255 districts are in southern Finland. Twelve are in Lapland, a region of less intense farming, less continuous forestry activities, and construction which is largely relief work.

54323. RISTIMÄKI, TOINI. Nuorukaisten ja täysi-ikäisten miesten arkiajan käyttö; maaseudun työvoiman tutkimuksia III. Helsinki, 1955. 21 p. tables. (Acta forestalia fennica, 63, no. 3.) 6 refs. Text in Finnish. Summary in English. ***Title tr.:*** Annual round of activity of youths and adult men; rural labor force studies III.

Approx. 75% of the Finnish rural male population aged 15–64 belong to farm-owning families, and the ratio of landed to landless is higher in the North. Work of youths (15–19 years of age) is 47% on the family farm, that of men (20–64 yrs.) 51%. In Lapland, relatively more youths than men work on the family farm. Input of paid labor, activity in forestry, agriculture, construction industry, etc., are compared for the two age groups. Data are given on seasonal changes, workless days, etc., youths without permanent occupation (36%), time devoted to study (12% total activity), etc.

1956. v. 70, no. 4, p. 171–81, text map.) 10 refs.

Outlines the topography and ecology of a locality (approx. 60° N. 101° W.) including McBride, Tod, Reindeer, Nueltin, and Baralzon Lakes; lists, with field notes, some two hundred flowering plants, 40 mosses and liverworts, and 22 lichens. ***Copy seen:*** DA.

54326. RITCHIE, J. C. The vegetation of northern Manitoba, 2; a prisere on the Hudson Bay Lowlands. (Ecology, July 1957. v. 38, no. 3, p. 429–35, illus., tables.) 11 refs.

A study confined largely to the lowlands along the estuary of the Churchill River (58°47′ N. 94°11′ W.). The lowlands consist of extensive glacio-fluvial deposits, highly calcareous. Continuous encroachment of vegetation on contemporary river flats is evident, and in a distinct sequence. Major features of the prisere (primary succession) are presented, ecological relationships of white and black spruce, the tree line dominants of the area, are discussed. This sequence, not universal in the region, runs as follows: meadow phase, shrub phase, invading forest (*Picea glauca* and *Larix laricina*), closed forest (*P. glauca*), black spruce open forest (with mound hollow topography). ***Copy seen:*** DA.

54336. ROBERTSON, ROBERT GORDON, 1917– . The future of the North. (Arctic circular, 1957. v. 10, no. 1, p. 2–7.) Ref.

Recent and prospective changes in northern Canada are reviewed in their human and economic aspects. Until about 30 yrs. ago Eskimos had been touched by white civilization only through the fur trade, whaling and missionaries. Since then, medicine, pensions, family allowances, etc., allow a population increase but the advance of civilization reduces the game supply, and creates need of cash income. Education, technical training, and social adjustment are required for Eskimos' employment and development: 1,270 positions are estimated to open for them during the next ten yrs. in government departments, DEW Line, transport, mining, and the Hudson's Bay Company. Increased development of the North is required to absorb a growing population but in adjustment to new economic conditions, Eskimos' and Indians' cultural heritage and independence must be preserved.

Copy seen: DLC.

54337. ROBERTSON, ROBERT GORDON, 1917– . The future of the North. (Western miner and oil review, Mar. 1958. v. 31, no. 3, p. 42–45, illus.)

Discusses development possibilities of northern Canada; increasing economic

growth is predicted, due to the growth in world population and increasing demand for metallic minerals and energy. Transportation problems are discussed; road- and railroad projects are sketched. Most important factor in developing the western part of the Northwest Territories is the proposed railroad to Great Slave Lake. Great Circle air routes Vancouver/Los Angeles-Europe crossing via Frobisher (62°30′ N. 66° W.) indicate a boom for that settlement. Native manpower should be utilized, as the North Rankin Nickel mine on the west shore of Hudson Bay has done in employing 70 Eskimos. ***Copy seen:*** DGS.

54338. ROBERTSON, ROBERT GORDON, 1917– . Huge mineral potential assured in Northwest Territories. (Western miner and oil review, Oct. 1958. v. 31, no. 10, p. 120+, illus.)

Outlines mining and prospecting activities and the state of transportation facilities. Gold and uranium account for 90% of the mineral production. Large lead-zinc deposits have been discovered at Pine Point (61°01′ N. 114°15′ W.), iron on Belcher Islands and Baffin Island. Gas and oil exploration has grown. A railroad to be built to Great Slave Lake is expected to speed mineral development of the Mackenzie valley.

Copy seen: DGS.

54339. ROBERTSON, ROBERT GORDON, 1917– . The mining industry in Yukon. (Western miner and oil review, Oct. 1958. v. 31, no. 10, p. 98–102, illus.)

Outlines mining and prospecting activities and the state of transportation facilities. The main mining center is the Mayo district (silver, lead, zinc, cadmium). Depressed prices have reduced prospecting activities for base metals; exploration for oil and gas is growing, spurred by recently announced federal plans for a major resource-development roads-construction program.

54340. ROBERTSON, ROBERT GORDON, 1917– . Northwest Territories and the Arctic. (Western miner and oil review, Apr. 1958. v. 31, no. 4, p. 100–101, illus., table.)

Summarizes exploration and development activities in 1957. Preliminary data on gold, silver, copper, nickel, pitchblende, crude petroleum, and natural gas production are tabulated and compared with the 1956 statistics. A total of 5,600 mineral claims were recorded in the Arctic Mining District, far surpassing the older, more southerly Mackenzie (330) and Yellowknife (1919) Mining Districts. ***Copy seen:*** DGS.

54341. ROBERTSON, ROBERT GORDON, 1917– . Roads projected for development of the Northwest Territories. (Roads and engineering construction, Apr. 1956. v. 94, no. 4, p. 114–15, illus., map.)

Discusses the NWT administration brief to the Royal Commission on Canada's Economic Prospects, emphasizing the economic importance of extending the railway from Grimshaw, Alberta to Great Slave Lake (Pine Point), and building new development roads to link mining centers and resources areas with main highways, or with a Hudson Bay port (Eskimo Point). Roads specified (cf. map) link the Mackenzie Highway with points around Great Slave Lake and north to Port Radium on Great Bear; join Fort Simpson to the Alaska Highway (at Fort Nelson); Fort McPherson-Dawson; Dismal Lakes-Coppermine; etc. Developmental prospects of each area are discussed in relation to transportation. ***Copy seen:*** DLC.

54343. ROBINSON, ELMER, *and others.* Ice fog as a problem of air pollution in the Arctic. (Arctic, 1957. v. 10, no. 2, p. 89–104, illus.) 11 refs. *Other authors:* W. C. Thuman *and* E. J. Wiggins.

Extensive field programs were undertaken in Alaska during the winters of 1952–1954 to determine the causes of ice-fog formation. Ice fog forms at temperatures near −30° C. and below in populated areas and is particularly troublesome at military installations. It poses no threat to health but seriously restricts visibility. The fog is a direct result of supersaturation of the cold air with water

vapor from man-made sources. The only methods of curtailing its formation appear to be restricting vapor emission into the air or confining emission to selected fall stacks. Microphotographs of ice fog particles collected at various temperatures are included. ***Copy seen:*** DLC.

Bulletin, v. 7, no. 1.) 45 refs. *Publ. also as:* Contrib. from the Scripps Institution of Oceanography, no. 917).

"The results of the analysis of 16,103 individual bathythermograph temperature observations and 129 serial reversing thermometer observations in the Gulf of Alaska and Northeast Pacific Ocean are presented in monthly charts of average temperature for 100-ft. levels between the surface and 400 ft. In addition there are charts of average annual temperature cycles, average vertical temperature sec-

tions, typical individual bathythermograph temperature curves, and typical T–S curves in the area. The major features in the temperature distribution are: a cold core of water of temperature less than 40° F. in the western half of the Gulf of Alaska; a warm tongue along the coast of British Columbia changing position with depth and time; and the large temperature gradient found along the coast of the United States. A statistical analysis of temperature variation at three locations within the area is presented."—Author's abstract.

As a basis for replanning an unemployment insurance program, past trends (particularly 1950–1957) are analyzed, and economic developments are outlined for 1958–1965 from three viewpoints: most favorable, intermediate and least favorable. Inter-relations between population, military personnel, and primary and secondary employment, and between population and tertiary employment are examined. The state is divided into three social-economic regions: (southeast, southcentral-interior, north-west) and their economies and employment patterns are analyzed in turn. Projected sets of figures on employment covered by the insurance program of 1958–1965 for each region and the state as a whole, and on wages and unemployment for the state are presented to correspond with the three views of the future. The south-central-interior region is most representative of the "New Alaska" which is characterized by pulp mills, oil, develop-

511326—60——62

ment of iron and coal deposits (possibly for shipment to Japan), nuclear power projects, trans-polar flight bases, and Statehood. ***Copy seen:*** CaMAI.

The Umkehr method of determining the vertical distribution of ozone is employed with data collected with a Dobson spectrophotometer at College during 1952–1954. The equipment, theory, procedure, results, and data are described in detail. The analysis shows a highly fluctuating distribution with possibly a larger percentage of the total ozone in the higher atmospheric layers than is normally measured at other stations. Infrared techniques for ozone monitoring are also given which are more favorable for the winter months than the regular UV measurements. Preliminary results suggest a possible correlation between the aurora and ozone.

Geologic report and map, scale 1:253,440, based on field work of June 15–Sept. 7, 1953, on air-photo-interpretation and on maps compiled by geologists of three mining companies. Topography of the area, approx. 56°–57° N. 68°–69° W., midway between Schefferville and Fort Chimo, is outlined. Discussion of the general geology is accompanied by a table of formations, which are mostly of the Proterozoic Kaniapiskau Group, consisting of five major and four minor, map units; thicknesses in four different parts of the area are shown and correlations inferred. Stratigraphy is discussed in some detail. Two companies have explored for iron unsuccessfully; small deposits of pyrrhotite, chalcopyrite, galena, sphalerite, bornite-chalcopyrite, and a discovery of copper mineralization are noted near the northern end of the area, which adjoins Lac Herodier, east half (No. 44848).

54389. ROSENDAHL, GUNNAR P. Vandforsyningsanlaeg i Godthåb. (Ingeniøren 1955. årg. 64, nr. 13, p. 293–97, 7 illus.) Text in Danish. ***Title tr.:*** Water works in Godthåb.

Describes construction of the water works at this West Greenland settlement. Since no access to natural water sources was available, an artificial lake was built to make use of the surface water. The plant, which has a capacity of 100 $m.^3$/hr. is partly furnished with artificially heated water-pipes. No separate connections have been laid to private homes, but several pumping stations have been built, where water can be obtained.

54392. ROSENDAHL, PHILIP, 1893– . Jagt- og fredningsregler i Grønland. (Atuagagdliutit: Grønlandsposten, May 22–June 5, 1958. Ukiut 98-iat, nr. 10, p. 15–16, 18; nr. 11, p. 16–18, 20.) Text in Danish and Eskimo. ***Title tr.:*** Hunting and protection regulations in Greenland.

Reviews the regulations by district and animal species. Only Danish citizens permanently resident in Greenland are permitted to engage in professional hunting. ***Copy seen:*** DLC.

54393. ROSENDAHL, PHILIP, 1893– . Jakob Danielsen kalâlek amîssok; titartagkat imilersarîssanigdlo amigkat. Godthåb, 1957. 87 p. + 32 p. in pocket. illus., 8 col. plates, maps. Text in Eskimo and in Danish (32 p.). ***Title tr.:*** Jakob Danielsen, a Greenlandic painter; drawings and watercolors. Eskimo language edition of No. 14832.

Contains nearly 250 reproductions (eight in color) of watercolors and pencil sketches with explanatory text. Several series depict events in the hunt of various animals; land- and seascapes, settlements, travel experiences are included; they derive largely from the Disko area, his home. In his portrayal of native equipment and techniques, the natural setting, especially weather phenomena, the artist presents a pictorial record of Eskimo life in the recent past. A biographic sketch of Danielsen 1888–1938 is included. The National Museum at Copenhagen maintains the collection of his work. ***Copy seen:*** DLC.

54394. ROSENDAHL, PHILIP, 1893– . Kårene i fangstdistrikterne. (Grønland, Feb. and Mar. 1958, nr. 2, p. 58–68; nr. 3, p. 99–110, illus., tables.) Text in Danish. ***Title tr.:*** Conditions in the hunting districts.

Discusses surveys of hunting in the Upernavik and Umanak districts and in the North and East Greenland inspectorates made by the Ministry for Greenland and based on hunting lists kept by the Greenlanders. Information is included on average catch per family by animal species calculated in weight of meat, and on average income from sale of products to the Trading Company. Living conditions are higher in a scattered than in a more dense population; probably also the income of the Trading Company (by export of skins). A concentration of hunters worsens hunting conditions, influences the dietary habits of the families unfavorably, and increases the need for state subsidies. Causes are discussed (p. 99–110) for the low living standard of the hunters in some areas despite the comparatively large catches: low prices for the skins, lack of meat as this is shared with the dogs, inferior housing, transport difficulties and lack of adequate schooling facilities. ***Copy seen:*** DLC.

54395. ROSENDAHL, PHILIP, 1893– . Rationel regulering af sælfangsten er en nødvendighed. (Grønland, Oct. 1958. nr. 10, p. 393–96, diagrs.) Text in Danish. ***Title tr.:*** Rational control of sealing is a necessity.

Advocates certain controls in the hunting of ringed seal in the northern districts of West Greenland, where this species shows signs of returning due to climatic changes. ***Copy seen:*** DLC.

54396. ROSENFELD, G. A., *and* K. M. HUSSEY. A consideration of the problem of oriented lakes. (Iowa Academy of Science. Proceedings, 1958. v. 65, p. 279–87, illus., text map.) 9 refs.

Some observed phenomena are not explained by theories which have been advanced on orientation. Of its two best-known examples in North America, the Carolina bays and the oriented lakes of northern Alaska, the latter is chiefly discussed. The origin of these lakes (cf. No. 2681) in local thawing and subsequent collapse of ground in areas of permafrost is noted. Both existing hypotheses suggest wind as the cause of orientation, one postulating a former prevailing wind in the direction of the long axis, the other, a wind normal to the long axis. The present prevailing wind is approximately at right angles to the long axis; evidence from the field and from air photographs indicates that the lakes are still being oriented. Geologic structure should be considered in seeking an answer to this problem.

Report on photic stimulation of the retina, optic tract, lateral geniculate body, and visual cortex of the hypothermic cat. A progressive fall in the responsiveness of the visual system was observed. The condition returned to normal upon rewarming.

Copy seen: DNLM.

54406. ROSS, CHRISTINE. Maiden voyage to the Antarctic. (Canadian shipping, Jan. 1957. v. 28, no. 4, p. 29–30, illus.)

Contains brief description of *Magga Dan*, Danish-designed and built, ice-strengthened ship, charted for the British Commonwealth Trans-Antarctic Expedition. Design features which make the vessel well adapted for navigating through ice include special protection for rudder when in reverse, steel fins to guard the propeller, and a special control bridge mounted at the head of the foremast. The bow is angled sharply to permit the ship to ride up on the ice thus utilizing its own weight in breaking the ice. The variable-pitched propeller is made of stainless steel. The ship is reinforced with steel ribs each foot of the length and has heavy plating at the stem, sides, and bottom. Navigation equipment is of latest type. ***Copy seen:*** DLC

54407. ROSS, JOHN EARL RATZ, 1892– . Geodetic surveys in Canada. (Royal Astronomical Society of Canada. Journal, Dec. 1957. v. 51, no. 6, p. 341–50, illus., map, table.)

Reports geodetic activities in the North. Triangulation and astro-fixation are still in use, but that of shoran trilateration has been intensified. The trilateration net of 1956 included 106 stations attached to 18 geodetic triangulation stations; 441 lines were measured. With the 1957 operation completed, there are 501 measured lines and 119 shoran stations over some 2.5 million sq. mi. The shoran fixation method, though inferior to first-order triangulation, is superior to astro-fixation. An average line measurement accuracy of one in 56,000 is indicated after the calibration error is applied. Due to systematic error not being eliminated in full degree, the error in position in the extreme northern limit of the net is assessed to be a possible 150′ with the probability of an occasional 300′ for external, remote stations.

Copy seen: DLC.

54408. ROSS, K. F. Mount Logan East Ridge. (Sierra Club bulletin, Nov. 1958. v. 43, no. 9, p. 68–70.)

Recounts first ascent of east summit of Mt. Logan via the east ridge, by five-man party on July 19, 1957. Difficulties of ascent and of the 100-mile trip over the Hubbard, Seward, and Malaspina glaciers are described.

54413. ROSSMAN, DARWIN LUCIAN, 1915– . Ilmenite-bearing beach sands near Lituya Bay, Alaska. Washington, D.C., 1957. 10 p. fold. map, 2 tables. Mimeographed. (U.S. Geological Survey. Reports, open file series, no. 420.) 4 refs.

Describes beach sands studied in 1952 in connection with field mapping of the Fairweather Range. Area covered, on foot or with a wheel plane, extends from Dry Bay to Dixon Entrance; samples were taken at about 5-mi. intervals from a point 7 mi. northwest of Lituya Bay to the northwest side of Dry Bay. Concentrations (5–40%) of gold, platinum and ilmenite occur on these beaches. Location, description, and magnetite and ilmenite content of 11 samples are summarized, as are results of chemical and spectrographic analysis of four samples of ilmenite. Main heavy minerals, and light minerals found in the beach deposits are noted; probable origin of heavy minerals in the igneous and metamorphic rocks to the northeast is suggested. Further investigation of these deposits, possibly for their combined content of ilmenite, gold, and platinum, seems warranted. ***Copy seen:*** DGS.

54414. ROSSMAN, DARWIN LUCIAN, 1915– , *and others*. Reconnaissance total intensity aeromagnetic map of the southern part of Prince of Wales Island, Alaska. Washington, D.C., 1956. Map sheet with text. (U.S. Geological Survey. Geophysical investigations. Map GP 135.) 12 refs. *Other authors:* J. R. Henderson, *Jr.*, *and* M. S. Walton, *Jr.*

Map (scale 1:126,720, contour interval 100 gammas) covers a 700 sq. mi. area, 54°40′–55°42′ N. 131°55′–133° W., just north of Dixon Entrance. Based on aeromagnetic survey, Sept. 20–21, 1945, recordings were made of variations in the earth's total intensity magnetic field by a modified AN/ASQ–3A airborne magnetometer. Purpose of survey was to locate magnetic iron and associated copper deposits; results include delineation of intrusive igneous rocks of area, with contact-metamorphic ore bodies along their margins. Most promising areas for exploration are noted. Extent of intrusive rocks is shown on inset map.

Describes difficulties of farming at the Noril'sk sovkhoz (69°20′ N. 88°06′ E.), northernmost in the U.S.S.R.: breaking virgin ground (moss-covered shrubby tundra), ploughing the top soil including the upper permafrost layer, fertilizing with humus, potassium phosphate and superphosphates (60–80 t./hectare), drainage, etc. Constant cultivation has lowered the permafrost level to 50–60 cm. depth. New land changes from pasture to field in two–three years. Cold-resistant cereal and vegetable strains are cultivated, barley, cabbage (yield up to 30 t./hectare), turnips, even corn (maize) and tomatoes (2½ kg./sq. m.) also hot-house vegetables and flowers. The sovkhoz

dairy farm has 900 cows with average annual yield to 3,400 liters milk. Poor pasture necessitates use of supplementary fodder concentrates. The town of Noril'sk and the train trip from Dudinka across the Taymyr tundra are sketched.

Discusses the anthropological differences of the upper and lower Chulym River Tatars and the lower Chulym Samoyeds. Crania excavated during various areal expeditions (1946–1950) are compared and their measurements tabulated (p. 347–73). The continued, parallel presence of these two autochthonous ethnic groups (confirmed by archeological observations) in the Chulym region marks it as an ancient melting pot of Europoids (from southwest Siberia) and Mongoloids (from the east). The more pronounced Mongoloid traits of the Tatars is ascribed to their early mixture with central Asiatic (Turkic) tribes. The Europoid features of the excavated Sel'kup (Samoyed) crania preclude the assumption of a Russian racial admixture responsible for their present Europoid traits.

(Biuletyn peryglacjalny, 1957. wydział 3, no. 5, p. 51–87, 187–224, illus., table, diagrs., map.) 47 refs. Text in Polish and French. ***Title tr.:*** Relief zones and periglacial phenomena in Torell Land, Spitsbergen.

"The distribution of various relief zones is discussed on the basis of studies during the Polish Spitsbergen Expedition of 1934, and the formations characterizing each zone are described. Phenomena in the littoral zone include regularly shaped depressions and gravel ridges formed by sea ice, fissures and polygons in clay deposits on slightly frozen gravel, nivation forms on steep slopes, sandy glaciers (patches of ice 3–4 m. thick), and blocks of dead ice. The zone situated above the coast (periglacial zone) exhibits three types of tundra: a humid tundra with well-developed solifluction phenomena and stone polygons, a dry tundra characterized by tundra polygons and striated soils, and detritic tundra in which nivation cirques and various forms of water erosion occur. The subnival zone features corrasion cirques, intense wind action,

and cryoconite sedimentation. Debris fields, stone agglomerations, corrasion ravines, avalanche gullies, and intense frost splitting occur in the nival zone."—SIPRE. ***Copy seen:*** DLC.

54431. *RUBBER DEVELOPMENTS.* Rubber at the South Pole. (Rubber developments, summer 1958. v. 11, no. 2, p. 58–60, illus.)

The British Trans-Antarctic Expedition used two types of rubber tracked vehicle (the Weasel and the Muskeg) and an adapted form of the Ferguson tractor with special cold-resistant rubber tires. Each track assembly of the Muskeg tractor comprises four pneumatic-tired twin wheels running within the track, which is made up of three narrow, endless, rubber-and-rayon belts reinforced with steel cables. The belts, slightly separated, are linked together transversely by a series of steel cross plates spaced at such intervals that the teeth of the driving sprocket project through the belts and engage with the cross plates. The drive sprockets, including the driving teeth, are made of fabric-reinforced rubber. The expedition also carried several kinds of rubber-soled shoe and a Numax inflatable hut, which yielded favorable results.

54436. RUDBERG, STEN. Ödemarkerna och den perifera bebyggelsen i inre Nordsverige; en diskussion av vissa orsakssamband bakom fördelningen bygd-obygd. Uppsala, 1957. 192 p. illus., maps (10 in pocket), tables, diagr. (Geographica, nr. 33.) 187 refs. Text in Swedish. Summary in English. ***Title tr.:*** Unsettled and frontier settlement areas in inner northern Sweden; a discussion of certain causal connections underlying the division into cultivated and uncultivated areas.

Large uninhabited areas are characteristic of this part of Sweden, due to natural conditions, location above the timber line, poor soil, etc., and to historical development. Colonization has varied from place to place: some localities have villages from medieval times, others have not been colonized until this century. During most of the period studied, form of land use has varied, but within the area, agriculture has remained steady. The farmers have had barley fields and potato patches but lived mainly on the yields of stock-raising, supplemented by hunting, fishing and forestry. Colonization is reviewed; and distribution of settlements is mapped at 50-year intervals from 1750 to 1950. Natural conditions: relief, earth cover, vegetation, climate are analyzed for this area and discussed as factors in its settlement. The present division into settled and unsettled areas has been determined not only by natural conditions. Other factors are involved: if individual villages and farms are legally entitled to use large unsettled areas this constitutes an obstacle to the establishment of new settlements and if the government can assert its right to the uninhabited areas the possibilities of colonization will depend on the government's interest in it. The present boundary is also often a boundary of retrogression, i.e., areas which now appear as uninhabited have earlier had permanent settlement, or have been used in the seasonal movement of herds to the mountains. ***Copy seen:*** DLC.

54437. RUDBERG, STEN. Some observations concerning mass movement on slopes in Sweden. (Geologiska föreningen i Stockholm. Förhandlingar, Jan.–Feb. 1958. bd. 80, häfte 1, p. 114–25, illus., tables.) 19 refs.

Introductory investigations in Sweden of mass movement by creep and solifluction on till-covered slopes and orientation of stones at the surface and in depth are discussed. Marking and recording of stones makes it possible to measure their movement from year to year. Orientation appears to be determined by (1) conditions immediately after ice retreat when the ground was water saturated and not covered by vegetation, and (2) by recent and current mass movements. Studies of differential movement in solifluction terraces near Abisko, Tärna, and in other Swedish localities are also reported. ***Copy seen:*** DGS.

Mines and Natural Resources. Mines Branch. Pub. 55–3.) 25 refs.

Detailed study of the complex structural geology of this area (approx. 54°50′ N. 99°50′ W.) about 90 miles northeast of The Pas, Man. Location, access and topography are stated. Four major Precambrian rock groups are described, summarized in table, and correlated: the basement group consists of two formations; intermediate group, several volcanic and sedimentary formations; younger sedimentary group: seven; five intrusive rocks: diorite, gabbro, amphibolite, peridotite, and granite, are determined as younger than these groups. Only the presence of feeder dykes of porphyritic basalt near Snow Lake suggests an unconformity between the layered rocks of the area. *Map* (1 in.:½ mi.) shows distribution of the formations. Two sets of vertical sections, arranged by a system of coordinates on the map, are included. Numerous faults have broken the rocks into a mosaic of blocks; at least two periods of folding have occurred. A nickel deposit on an island in Herb Lake, limited copper-zinc zones of mineralization, and deposits containing lithium, beryllium, and gold are cited.

Tabulates catches, costs, and profits of this Norwegian coastal fishery in 1954 according to equipment and size of vessel, also average crew shares of the profits 1946–1954. ***Copy seen:*** DLC.

54462. RUZHITSKIĬ, V. O. Almazy drevnego Timana. (Vokrug sveta, Feb. 1958, no. 2, p. 1–4, illus., map.) Text in Russian. ***Title tr.:*** Diamonds of ancient Timan.

Recalls the find of a diamond in the Timan Ridge, on the bank of Mezenskaya Pizhma River by a peasant Iona Popov in tsarist times, and his vain attempts to interest the government in his discovery. Several diamonds have been found recently in the same area by two geologists, S. A. Godovan and M. I. Plotnikova. An expedition to search for diamonds in the Pechora River basin is planned for summer 1958 by the Komi Branch of the Academy of Sciences. Discovery of diamonds in the Ural and Yakutia are noted. ***Copy seen:*** DLC.

54463. RUZHITSKIĬ, V. O. Almazy nedr Evropeĭskoĭ chasti SSSR. (Priroda, Dec. 1957, no. 12, p. 88–91, text map.) 5 refs. Text in Russian. ***Title tr.:*** Diamonds of the European U.S.S.R.

Contains a review of old literature dealing with finds of diamonds in that region, and recent (1952–56) discoveries of diamond deposits on the rivers Menzenskaya Pizhma, Tsil'ma and Pechorskaya Pizhma in the Arkhangel'sk province. Individual diamonds were also found in the southern Russian platform, in the basins of Dnepr, southern Bug and Dnestr rivers. It is suggested that the Kola Peninsula might have diamond deposits and kimberlite pipes. ***Copy seen:*** DLC.

54464. RUZOV, LEONID VLADIMIROVICH. Na sushe i na more v Arktike. Moskva, Izd-vo "Morskoĭ transport," 1957. 243 p. illus., ports., 4 maps. Text in Russian. ***Title tr.:*** On land and sea in the Arctic.

Deals with the activities of the Soviet polar stations on the shores and islands of the Kara and Laptev Seas during the period 1932–1938, especially that on Cape Chelyuskin, headed by the writer in 1933–34 and 1935–36. Exploration in the Taymyr Peninsula area is reviewed from S. I. Chelīuskin's in the 18th century. Establishment of the station on the northern tip of Cape Chelyuskin in 1932, life and work there with the first relief team, 1933–34 and development of the station under I. D. Papanin in 1934–35 are described. During the author's second stay (1935–36), exploration of Taymyr Peninsula was carried on, also (winter 1936) extensive investigation of Shokal'skogo and B. Vil'kitskogo Straits by a hydrological party under B. I. Danilov (map p. 185), wildlife observations, hunting and trapping, etc. Relations with the stations at Cape Olovyanyy and Domashniy Island in Severnaya Zemlya, and at the Taymyra River mouth, Komsomol'skaya Pravda Islands, etc. are noted, also operations on the Northern Sea Route, ships en route and in convoy by the ice-breakers *Rusanov, Krasin, Chelīuskin, Sedov, Sibiriakov,* and *Lenin;* air reconnaissance and rescue flights. Use of sledge dogs and general purpose snow tractors are discussed. Hardships of work during the polar night are mentioned, also the gradual improvement in equipment, housing, food and health conditions, and development of methods of observation and exploration. O. Īū. Shmidt, I. D. Papanin, É. T. Krenkel', G. A. Ushakov and other arctic explorers are introduced as the author encountered them. His unsuccessful attempt to establish a station on Sannikov Strait in 1937 is recounted. The forced wintering of five steamships and the ice-breaker *Lenin* in the Laptev Sea, the winter 1937–38 drift of the ice-bound *Lenin* (map, p. 218) and work of an improvised hydrological team headed by N. M. Storozhev are some of the many events and activities covered in this informative chronicle.

Text in Danish. Summary in English. ***Title tr.:*** The auroral zone's influence on radio communications from Denmark.

Ships sailing between Denmark and the west coast of Greenland often experience difficulties in maintaining regular radio communications with short-wave stations in Denmark from the waters east of Cape Farvel. Measurements show that the field strength of the atmospherics is nearly constant along the 60° latitude toward Greenland; the poor receiving conditions must be ascribed to the low field strength of signals from Denmark. A comparison between the measurements and the theory developed by the Central

Radio Propagation Laboratory in U.S.A. seems to confirm the existence of a ring-shaped absorption area around the geomagnetic North Pole and roughly coinciding with the auroral zone. Radio waves passing through the D-layer in this area on their way upwards or downwards from a reflection at the E- or F-layer are subjected to heavy absorption.

54492. SAEMANN, J. C., *and* G. W. WASHA. Variation of mortar and concrete properties with temperature. (American Concrete Institute. Journal, Nov. 1957. v. 29, no. 5, p. 385–95, illus., tables, graphs.)

Effects of temperature upon strength, stiffness, and toughness of mortars and concretes are given. Two mortars and two concretes varying in cement content, and one lightweight concrete were used. Mortar cubes, briquets, cylinders, beams, and concrete cylinders, after a 24-hr. pre-conditioning treatment, were tested at −70° to 450° F. In the subnormal range, as temperature decreased, mortar and concrete properties generally increased. The variation with temperature is graphed. Sand-and-gravel concrete and expanded-shale concrete responded similarly to temperature variations.

54493. SAETERSDAL, GUNNAR SELMER, 1922– . Rapport om tokt med "G. O. Sars" til Barentshavet 1. mars til 12. april 1954. (Fiskets gang, May 13, 1954. årg. 40, nr. 19, p. 234–35, illus.) Text in Norwegian. ***Title tr.:*** Report on cruise aboard the *G. O. Sars* to the Barents Sea Mar. 1–April 12, 1954.

Barents Sea temperatures were investigated during an early spring cruise east of Bjørnøya and north of Norway. Ship's route and sea temperature profile are shown and conditions compared with 1953. Occurrence of fish is discussed; 1,200 fish were tagged.

Copy seen: DLC.

54494. SAETERSDAL, GUNNAR SELMER, 1922– . Rapport om tokt med "G. O. Sars" til Barentshavet 16. september til 3. november 1954. (Fiskets gang, Dec. 16, 1954. årg. 40, nr. 50, p. 607–609 +, diagrs.) Text in Norwegian. ***Title tr.:*** Report of a cruise aboard the *G. O. Sars* to the Barents Sea, September 16–November 3, 1954.

Route of the cruise is mapped between 70° and 77° N., 20° and 50° E. Sections of the West Spitsbergen coast, several fishing banks, and the Murmansk coast were visited. Temperature measurements were made; the Arctic and Atlantic currents are described geographically and comparisons with 1953 measurements are given. Experimental fishing and fish tagging were done. Fish age-class determinations and the 1953–1954 fishing results lead to the supposition that age classes are not always well represented in a season's catch. Polar cod as a whale food is discussed.

Glas. 1956. kn. 11, p. 119–24, tables.) 9 refs. Text in Serbo-Croatian. Summary in French. *Other authors:* A. Bata *and* V. Uzelac. ***Title tr.:*** Effect of hypothermia upon peripheral motor-nerve excitability in adrenalectomized white rats.

Account of experiments indicating that bilateral adrenalectomy produces within 72 hrs. a diminution of peripheral neuromotor excitability which coincides with a drop of core temperature. Artificial hypothermia is easier produced in these animals, and further reduces nervous excitability. ***Copy seen:*** DNLM.

54501. SAIDOVA, KH. M. Kolichestvennoe raspredelenie foraminifer v Okhotskom more. (Akademiîa nauk SSSR. Doklady, June 21, 1957. t. 114, no. 6, p. 1302–305, 3 text maps.) 10 refs. Text in Russian. ***Title tr.:*** Quantitative distribution of Foraminifera in the Okhotsk Sea.

Study based on the collections of the research vessel *Vitîaz'* in 1949–52 (3,000 samples). Distribution of calcareous bottom foraminifers is mapped: maximum in northern and southern sections of the sea, minimum in the Deryugin and TINRO depressions; boreal and subtropical Pacific species. Agglutinated (sand) foraminifers are distributed in all sections of the Sea: maximum in western shallow waters, Shelekhov Bay and off the southern extremity of Kamchatka; content: arctic-boreal species. Map 3 gives the distribution of planktonic foraminifers (maximum in the Deryugin depression, central section of the Sea and southern Kamchatka waters; minimum in the shallow coastal waters; content: chiefly *Globigerina pachyderma* and a few *G. bulloides*). The distribution of foraminifers is influenced by many factors, such as the sea-water temperature, salinity, content of oxygen, iron and $CaCO_3$, mechanical properties of the sea bottom, depth, etc. ***Copy seen:*** DLC.

54502. SAIDOVA, KH. M. O raspredelenii foraminifer v tolshche osadkov Okhotskogo morîa. (Akademiîa nauk SSSR. Doklady, Aug. 21, 1957. t. 115, no. 6, p. 1213–16, text map.) 7 refs. Text in Russian. ***Title tr.:*** The distribution of Foraminifera in the deposits of the Okhotsk Sea.

Vertical distribution of foraminifers is studied on the basis of bottom deposit

analyses. Three complexes were selected: the continental shoal with nine groups; the continental shelf, nine groups; and the central part of the sea, comprising the Deryugin depression, submarine elevations and the southern deep depression: three groups. Oceanographic conditions and species, listed for each horizon, are noted and discussed. The foraminifer fauna of the Okhotsk Sea deposits belongs to the Quaternary era; the two lower horizons corresponding to the Pleistocene. During the accumulation of Quaternary deposits, this study indicates, the basin of the Okhotsk Sea was slowly sinking.

54504. SAINSBURY, CLEO L., 1921– . A geochemical exploration for antimony in southeastern Alaska. (*In:* U.S. Geological Survey. Mineral resources of Alaska 1954–55. Bulletin, 1957, no. 1024–H, p. 163–78, 5 maps incl. 3 fold., plate, 3 tables.) 5 refs.

Describes application of geochemical techniques to exploration for ores. Preliminary geochemical prospecting was carried out in this muskeg-covered area (Caamaño Point, Cleveland Peninsula, approx. 56° N. 132° W.) to delimit areas of stibnite concentration. Following overall soil sampling, detailed testing of promising areas proved the presence of stibnite ore, demonstrating the economic fesibility of geochemical exploration to extend mineralized areas and locate favorable portions of near-surface ore bodies. Tabular data suggest values of soil content of antimony considered normal in this type of terrain, but the method offers a new and inexpensive approach to prospecting in a region where conventional methods are slow and costly.

54505. SAINSBURY, CLEO L., 1921– . Some pegmatite deposits in southeastern Alaska. (*In:* U.S. Geological Survey. Mineral resources of Alaska 1954–55. Bulletin, 1957, no. 1024–G, p. 141–61, illus., plate, 4 text maps, 2 tables.) 4 refs.

Describes geology of two areas that contain pegmatite bodies of possible commercial significance. One deposit, near Redfish Bay on the west coast of Baranof Island (approx. 56°30′ N. 135° W.), was examined in Sept. 1953 and Aug. 1954; it contains microcline-perthite, two varieties of mica, and large euhedral quartz crystals, all of possible economic value. The second deposit, near Sitklan Passage (approx. 54°50′ N. 130°45′ W.) and the Alaska-Canada boundary, studied in May 1953 and Sept. 1954, contains mica books of commercial size and grade, but perhaps not, because of crushing and foliating, in commercial quantities. This pegmatite consists mainly of albite or albite-oligoclase and quartz in fine intergrowths, available in large amounts, but difficult of separation. ***Copy seen:*** DGS.

54506. ST. AMAND, PIERRE, 1920– . Geological and geophysical synthesis of the tectonics of portions of British Columbia, the Yukon Territory, and Alaska. (Geological Society of America, Bulletin, Oct. 1957, v. 68, no. 10, p. 1343–70, 11 maps, incl. 1 fold., 2 diagrs., 2 tables.) 65 refs.

Contains discussion of seismic activity of Alaska, its association with the Aleutian Island arc and with a line of faulting in southeastern Alaska that appears to be the northward extension of the San Andreas fault system. Increased activity is noted where the Aleutian Range intersects the Alaska Range and where the Chugach Mts. intersect the Aleutian Range. The Denali fault is traced from Bering Sea past Mt. McKinley to Cape Decision in Christian Sound (approx. 56° N. 134°30′ W.), and the supposed "Lake Clark" line of faulting, generally

parallel, is traced to the St. Elias region, both joining a northward extension of the San Andreas system. The major Yakutat Bay earthquakes, 1899, took place, perhaps, on a lateral fault running from north of Yakutat Bay to south of the Queen Charlotte Islands (53° N. 132° W.). Maps show distribution of mountain ranges and other physiographic features, location of fault zones, and seismic activity, submarine topography of Aleutian waters; changes in elevation and sea level are graphically presented; geodetic observations and earthquake data are summarized in tables. Seismic and geologic data indicate that the North Pacific Basin, from Lower California to the Kuril Islands at least, has long been rotating counterclockwise.—From author's abstract. ***Copy seen:*** DGS.

54507. ST. JOHN, RICHARD, *and* **R. M. NARDONE.** Eosinophil levels of the turtle after exposure to cold and epinephrine. (American journal of physiology, Feb. 1957. v. 188, no. 2, p. 420–22, illus.) 6 refs.

In the turtle, *Pseudemys elegans*, cold environment produced eosinopenia; epinephrine injection, an eosinophilia; a combined treatment resulted in eosinopenia. The results suggest that the turtle shows an endocrine response to cold stress.

54510. SAKAI, AKIRA. The frost-hardening process of woody plant, 2; relation of increase of carbohydrate and water soluble protein to frost-resistance, 2. (Teion kagaku, 1958. v. 16, ser. B, p. 23–34, illus., tables.) Text in Japanese. Summary in English.

Frost resistance of cortical tissues of mulberry twigs was found to parallel their sucrose concentration, but not the concentration of their water-soluble protein. Hardening by exposure to 0° C. increased from late September to late October; this was also evident in artificially dehydrated parenchyma cells and suggests that hardiness cannot be determined solely by the values of osmotic concentration in these cells. Tissue sections of the twig's cortical layer also showed increasing survival after freezing, toward the end of October.

54519. SAKS, VLADIMIR NIKOLAEVICH, *and* **Z. Z. RONKINA.** ĬUrskie i melovye otlozheniĭa Ust'-Eniseĭskoĭ vpadiny. Pod red. L. B. Rukhina. Moskva, Gosgeoltekhizdat, 1957. 232 p. illus., diagr. (part fold.), tables incl. part fold., maps. (Leningrad. Nauchno-issledovatel'skiĭ institut geologii Arktiki. Trudy, t. 90.) 83 refs. Text in Russian. ***Title tr.:*** Jurassic and Cretaceous formations of the Ust'-Yenisey basin. L. B. Rukhin, editor.

Exhaustive study of the regions (approx. 66°–72° N. and 78°–90° E.), which lie between the Taymyr folded zone and the Siberian platform. Stratigraphy (p. 8–98), lithology (p. 99–139), series and facies of the Jurassic and Cretaceous systems (p. 140–83), tectonics (p. 184–207), and geological history (p. 208–228) are treated in turn. The Ust'-Yenisey basin with Paleozoic underlying, in the Jurassic and Cretaceous periods was covered by sea, leaving a great amount of sediments, in the central part 4.5 – 5 km. thick. Fixing the stratigraphy and description of the composition of facies of Mesozoic deposits was the main task of this study. It is based on 1951–54 field work of a team of scientists of the Institute of Geology of the Arctic. The party comprised the geologist V. N. Saks, lithologist Z. Z. Ronkina, V. I. Bodylevskiĭ and N. I. Shul'gina as paleontologists, N. V. Shanovskaĭa as micropaleontologist, also E. N. Kara-Murza, N. M. Bondarenko and V. D. Korotkevich for pollen analyses. Tabular summary is given (no. 84) of a complete classification. The presence of oil is discussed as a theoretical possibility: its existence in the Lower and Middle series of the Jurassic system is more than doubtful, but possible in the Upper Cretaceous. ***Copy seen:*** DGS.

Nauchno-issledovatel'skiĭ institut geologii Arktiki. Informatsionnyĭ biulleten', 1958. vyp. 11, p. 22–30.) Text in Russian. *Other authors:* N. I. Shul'gina, V. A. Basov, and E. G. Iudovnyĭ. ***Title tr.:*** Preliminary results of investigation of Jurassic and Lower Cretaceous deposits in the region of Anabar River and Anabar Bay in 1958.

Reports on the lithologic composition of these deposits on the banks of the Anabar River, on Anabar Bay and Cape Paksa (approx. 73°–74° N. 112°–114° E.) as investigated by the geologist V. N. Saks, paleontologist N. I. Shul'gina, and the micropaleontologists V. A. Basov and E. G. Iudovnyĭ, to aid in working out a new stratigraphic division of the Jurassic and Cretaceous systems of the Soviet Arctic. Various periods, series and facies are briefly outlined and paleontologic characteristics and index fossils identified. Further studies in 1959 are mentioned.

(Leningrad. Nauchno-issledovatel'skiĭ institut geologii Arktiki. Informatsionnyĭ biulleten', 1958. vyp. 7, p. 5–9.) Text in Russian. ***Title tr.:*** Conference on geology and useful minerals of the central Krasnoyarsk region in the M. V. Lomonosov State University at Moscow.

Reports many geologists representing various geologic organizations attended this conference held in Feb. 1958. At the plenary meeting L. A. Ragozin reported on the Yenisey Expedition organized by the University of Moscow and S. V. Levchenko on mineral resources in the Krasnoyarsk region. The Krasnoyark region and the Siberian platform were main subjects for sections meetings: Paleozoic and Precambrian, Mesozoic and Cenozoic, Quaternary and tectonics, and mineral resources. The Institute of the Geology of the Arctic presented seven reports on geologic structure, diamonds, and rare metals in the northern part of the Siberian platform. Authors and topics are indicated for many of the reports presented.

Trudy, t. 92, Nefte-gazonosnost' severa Sibiri, 1958. p. 44–60, maps.) Text in Russian. ***Title tr.:*** Stratigraphy of the Jurassic and Cretaceous deposits in the central zone of the Soviet Arctic.

Presents a paleogeographic and stratigraphic review of these deposits distributed in abundance in north West and Central Siberia and in the arctic islands. Their development, lithologic, faunal and floral characteristics and stratigraphic units are outlined. For Toarcian, Bathonian, lower Kimmeridgian, upper Valanginian, Barremian, and Turonian times, the facies and possible sources of dispersal material are mapped and explained. The most promising possibilities for oil and gas are in the Ust'-Yenisey, Anabar-Khatanga, and the Lena-Olenek regions.

From Zoological Museum, 19.

Contains records of 49 recoveries, with notes on eight of the more interesting cases giving new migration data on some species. See No. 25794–95 and 42254 of *Arctic Bibliography*, for previous lists. ***Copy seen:*** DA.

54528. SALT, REGINALD WILSON, 1910– . Influence of moisture content and temperature on cold-hardiness of hibernating insects. (Canadian journal of zoology, Aug. 1956. v. 34, no. 4, p. 283–94, illus.,' tables.) 6 refs. Contribution no. 3424 Entomology Div., Science Service, Canadian Dept. of Agriculture.

Cold hardiness (measured in terms of supercooling) was only affected by moisture when the latter affected the concentration and hence the freezing point of the body fluids. Cooling at constant low temperature increased cold hardiness in one out of four species exposed, but variable temperatures of a natural environment produced cold hardiness in all four species. ***Copy seen:*** DLC.

54529. SALT, REGINALD WILSON, 1910– . Relationship of respiration rate to temperature in a supercooled insect. (Canadian journal of zoology, June 1958. v. 36, no. 3, p. 265–68, illus.) 4 refs.

Account of measurements of O_2-consumption in mature larvae of *Anagasta kühniella* Zell. down to a temperature of −15° C. The rate of consumption showed a logarithmic relationship to temperature over the whole range whose upper limits were close to 40° C. The bearing of the findings to Kozhanchikov's (q.v.) theory is discussed. ***Copy seen:*** DLC.

54530. SALT, REGINALD WILSON, 1910– . Role of glycerol in producing abnormally low supercooling and freezing points in an insect *Bracon cephi*, Gahan. (Nature, *London*, May 3, 1958. v. 181, no. 4618, p. 1281, illus.) 5 refs.

Supercooling as low as −47° C. was observed in the overwintering larvae of this species, a parasite of the wheat-stem sawfly. Analysis revealed their glycerol content was "20.0%, calculated as percentage of glycerol plus water content." This and sugars, salts, neutral solutes, etc. explains the excess super cooling point depression in this species.

Account of experiments demonstrating "that hypothermia increases the mortality rate in rabbits with a virulent infection" and converts an avirulent pneumococcal infection into one causing 69% mortality. Penicillin injected prior or during cooling prevented death in the majority of animals. ***Copy seen:*** DNLM.

54541. SANDERSON, IVAN TERENCE. Follow the whale. Boston, Little, Brown & Co., 1956. 423 p. illus., tables, maps. About 150 refs.

A history of whaling with emphasis on early and most recent times, and a natural history of whales. Prehistoric (ca. 10,000 to 3000 B.C.), the Phoenician and Graeco-Roman period, the whaling activities of the Norse, Japanese and Basques (500 to 1600 A.D.) are treated in turn. British, Dutch and American whaling (p. 145–284) and the modern period beginning by 1875 (p. 287–344) are chronicled. The phylogeny and taxonomic relationship of the whales, anatomic relation to other mammals, dolphins, freshwater forms are briefly outlined. Appended are chronologies of whaling as from 1550 A.D., and of whales as from 60 million years ago; evolution of whales' tails, and comparative sizes of whales are outlined; living whales are listed: 51 species, with illus., common and Latin names. ***Copy seen:*** DLC.

Ice motion surveys were established to find the character of movement in the surface ice and to help determine the mass budget. Chief tool used was stereophotogrammetry; surveys were made with a T–2 theodolite incorporated in a Wild T–30 phototheodolite. Four lateral profiles and a set of five stakes in the terminus were positioned in May and June and surveyed until October. Survey procedure is described; effect of variation of weather on accuracy is noted; problems encountered indicate surveys not accurate enough for detailed motion analysis.

Copy seen: DN–HO.

54562. SAUNTE, LISE HÖST. Cytogenetical studies in the *Cochlearia officinalis* complex. (Hereditas, 1955. bd. 41, häfte 3–4, p. 499–515, 5 illus., 4 tables.) 37 refs.

The chromosomes of 59 samples of the scurvy grass *C. officinalis* complex from Scandinavia, Great Britain, and Greenland have been counted. All plants from Greenland and Iceland have the miotic number of 14. It is suggested that all the 14-chromosome types be included into one species under the name *C. groenlandica* L. *C. danica* should be maintained as a separate species. It is also proposed to follow Ascherson and Graebner and give the *officianalis* and *anglica* types rank as subspecies: *eu-officianalis* and *anglica.*

Text in German. ***Title tr.:*** The history of the Baltic Sea.

Detailed, thoroughly documented, regional study of the Baltic and its coasts, especially of changes in sea level and shore lines since the Pleistocene. Chapters 15 and 16 (p. 412–469) describe coastal changes in northern Fennoscandia, and northern Sweden. Earlier research, from the time of Hjärne in Sweden, is reviewed, and the work of Tanner is recognized. Diagram shows the relationship of raised shorelines in several parts of northern Fennoscandia; maps show extent of postglacial seas.

54566. SAUVÉ, PIERRE. Preliminary report on De Freneuse Lake area (east half) New Quebec. Quebec, 1957. 7 p. fold. map. (Quebec. Dept. of Mines. Geological Surveys Branch. Preliminary report, no. 358.) 5 refs.

Maps (1 in.: 1 mi.) and outlines geology of this approx. 160 sq. mi. area (58°15′–30′ N. 69°00′–15′ W.) northwest of Fort Chimo. It is underlain by moderately to highly metamorphosed rocks of Precambrian age. Rock formations include metasedimentary and metamorphosed igneous rocks belonging to the Labrador Trough, and microcline gneisses which, in part, are probably metamorphosed Trough

rocks. The change from schists to gneisses possibly marks the eastern contact of the Trough. The structure of the area, folded, is discussed, also the eastward increase in metamorphism, and the origin of the gneisses. Occurrences of copper, nickel, zinc and iron appear to be of little economic value. ***Copy seen:*** DGS.

Danish. ***Title tr.:*** The movement of West Greenland.

Contains a survey of isostasy in West Greenland since the mid-19th century. According to various series of measurements, the land was sinking until about 1940 and is now rising by about 40 mm. a year. Methods used are described and data given. ***Copy seen:*** DLC.

54586. SAXOV, SVEND. Gravity in western Greenland, from 66° N. to 69° N. København, Bianco Luno, 1958. 34 p. tables, maps, incl. 1 fold., diagrs. (Denmark. Geodaetisk institut. Skrifter, raekke 3, bd. 29.) Approx. 50 refs.

Results of detailed gravity survey (1953–57) of the area between Søndre Strømfjord and Disko Bugt are presented together with principal facts for the stations. Observation accuracy is analyzed, also measurements carried out at Martin's stations (No. 46642). The Bouquer anomaly map is discussed, also relationship between gravity and land uplift. Data on (1956) calibration measurements along the European Gravimeter Line, Oslo-Hammerfest, of the Worden gravimeter used in the survey, are tabulated and compared with values obtained with a Frost C–1–20 gravimeter. ***Copy seen:*** DGS.

54587. SAXOV, SVEND. Ringbolte, vandstand og tran i Umanak. (Grønland, Nov. 1958, nr. 11, p. 419–22, illus., map.) Text in Danish. ***Title tr.:*** Ring bolts, water level and train oil at Umanak.

Reports measurements taken in Umanak harbor (70°40′ N. 52°09′ W.) West Greenland, to determine changes of level. A ring bolt used by K. J. V. Steenstrup in 1879–80 for the same purpose was used, as well as two older ones, probably dating from 1796. According to measurements at the Steenstrup ring bolt, the land has sunk 1 m. between 1879 and 1939 (measurements by Dan Laursen) and risen 0.4 m. 1939–1957. The two older ring bolts and examination of train oil stains on the rock confirmed these finds. ***Copy seen:*** DLC.

54588. SAXOV, SVEND. The uplift of western Greenland, a preliminary note. (Dansk geologisk forening. Meddelelser, Jan. 1958. bd. 13, hefte 6, p. 518–23, tables, graphs.) 14 refs. Summary in Danish.

Reviews the various means of measuring changes of level on the Disko Bugt coast and the results achieved. During 1879–1939 there was average annual subsidence of 17 mm. at Umanak and 12 mm. at Jakobshavn, and for the period 1939–1957 there has been uplift averaging annually 20 mm. at Umanak and 17 mm. at Jakobshavn. Similar measurements were begun at Fiskemesterns Havn in Søndre Strømfjord in 1957. Astronomical observations in Qôrnoq in 1927 and 1948 do not indicate a westward displacement of Greenland, as reported elsewhere.

54594. SCHAEFER, HELMUT. Entstehung der subarktischen Grosstadt Workuta, Nordural. (Erdkunde, Aug. 1957. Bd. 11, Heft 3, p. 204–215, maps, plan.) Text in German. Summary in English. ***Title tr.:*** The origin of the sub-arctic city of Vorkuta, northern Ural.

Conditions in the northernmost Russian coal-mining center are described by a German naturalist, who had been arrested by the Soviet army of occupation and sent to work at Vorkuta and Inta during 1950–55. The town originated as a camp for political prisoners in 1929–30; coal was discovered by a hunter and the first shaft sunk in 1933, transportation difficulties were great till the railroad was built in 1941. The Pechora coal basin became important during World War II, and after the war Vorkuta was developed with the forced labor of prisoners and deportees. The area around the oval-shaped coal basin is described and mapped (from memory): the 20 producing settlements and shafts linked by railway and auto road; the main sectors of the city, and its principal buildings: power stations, hospitals, mining school, etc., are noted. Climatic conditions are severe, with a mean temperature of −7° C, a January mean of −30° C. and a 240-day snow cover. Food, clothing and health conditions have improved recently; local agriculture is negligible though some vegetables are grown in hot houses, radishes in the open ground. Mining operations are being mechanized, manpower both forced and free, is becoming hard to get. Developments at Vorkuta are compared with those of Kiruna in Sweden. Estimates are offered of population of the area (250,000), coal output (10 million tons a year), and the resources of entire basin total approx. 20 billion tons. Foundation of mining center of Inta by forced labor in 1936 is recounted (p. 204–205). ***Copy seen:*** DGS.

54596. SCHALK, MARSHALL. Relation of arctic storms to shore-line changes at Point Barrow, Alaska. (Geological Society of America. Bulletin, Dec. 1957. v. 68, no. 12, pt. 2, p. 1792, 1910.)

Abstracts paper presented at the Society meeting in Atlantic City, Nov. 1–3, 1957, and at the Eighth Alaskan Science Con-

ference in Anchorage, Sept. 10–13, 1957. Describes studies of changes in bottom profiles caused by storms. A bar, not in existence in 1954, but found in 1955 surveys is considered to have been built by abnormally large waves during a severe storm in Oct. 1954. Comparisons with other storms in 1954 and 1956 indicate that, given a profile for the region, it should be possible to predict whether a storm exceeding a critical intensity will have no effect or will throw up a bar.

Presents results of strip tensile and burst tests (to −50° F.) on Smith X52 grade line pipes of commercial, semi-killed steel to determine their suitability for low-temperature service. Strength, circumferential strength, type of fracture, and tendency to shatter were investigated. It is concluded that, though inferior to specially alloyed, heat-treated steel in notch toughness, this less expensive type of steel is suitable for low temperature service provided care is exercised in welding and trenching.

54601. SCHELL, IRVING ISRAEL, 1906– . On the distribution of icebergs in the Northern Hemisphere with special reference to south of Newfoundland.

(*In:* International Union of Geodesy and Geophysics. Association of Scientific Hydrology. General Assembly, Oslo, Aug. 1948. Procès-verbaux des séances. t. 2, Travaux de la Commission de la Neige et des Glaciers, p. 19–21.). 9 refs.

From iceberg counts off Newfoundland, 1880–1948, and observations off East Greenland and north of Siberia, drifting bergs in north polar waters are found more numerous in recent years, and this is attributed to widespread warming releasing them from the fiords and bays. In Baffin Bay and Davis Strait, however, bergs are freed by factors not directly related to pressures and temperatures in the North Atlantic; this affects berg distribution off Newfoundland, and complicates prediction of iceberg conditions in that area. Circulation of waters and bergs west of Greenland should also be studied in relation to the Newfoundland situation. ***Copy seen:*** DGS.

54602. SCHELL, IRVING ISRAEL, 1906– . Theory of ice ages. (Science, Feb. 8, 1957. v. 125, no. 3241, p. 235.) 2 refs.

The author takes exception to some of the assumptions of Ewing and Dunn (cf. No. 44828). He doubts whether a greater interchange between Atlantic and arctic waters would cause a cooling of the former and whether the shrinkage, or disappearance, of the ice cover from the Arctic Ocean would favor the growth of glaciers further south, as postulated by them. To support his view he points out that the shrinkage of the polar ice pack during the past 50 years or so is accompanied by extensive glacier recessions in the Northern Hemisphere.

54603. SCHERHAG, R. The role of tropospheric cold-air poles and of stratospheric high-pressure centers in the arctic weather. (*In:* Polar Atmosphere Symposium, Oslo, 1956. v. 1, *pub.* 1958. p. 101–117, maps, diagrs.) 9 refs.

Mean height charts for the Northern Hemisphere at the 1,000-, 500-, and 50-mb. levels are presented based on the 40-yr. means, 1900–1939. Significant features of the circulation pattern are noted. Mention is made of two pronounced cold winter lows, over eastern Siberia, and the Canadian Archipelago, at 500 mb.; at the 50-mb. surface, only one pronounced cold low is found, near the North Pole. Changes of pressure and temperature in both arctic troposphere and stratosphere present many problems.

Study of this valley (approx. 69°30′ N. 20°30′ E.) in North Norway, based in part on author's field work in 1955 and 1956. Its geographic history and settle-

ment (from 1723) are outlined. The population was 130 in 1801, in 1891, 431, mostly Lapps with some Finnish and Norwegian immigrants; and in 1955 the population was 853, but without any ethnic lines of demarcation. Housing, fishing, agriculture and home industries are treated in detail, both before and after the evacuation in 1944. When the inhabitants returned in 1945, Manndalen became part of a wider economy within the framework of the post-war development plan for north Norway. Government aid and the war indemnity raised the standard of living. Larger, modern houses and cowsheds were built to replace the small timber cottages and the Lapp huts used to house the animals. The men, who formerly took part in the seasonal fisheries in Lofoten and Finnmark and fished in home waters, and until 1917 carried on barter trade, now went logging in Sweden. Agriculture was developed but some subsidiary means of subsistence is necessary. Home industries have declined appreciably since the resettlement. ***Copy seen:*** SPRI.

Treatment of collections obtained on the coast of Labrador by Prof. E. Meyer, W. J. Hooker and the missionary Henne (near Nain). An annotated list includes two fungi, 17 lichens, 13 mosses and liverworts, two ferns and 204 flowering plants. Some geographical notes on the Labrador coast by Lt. Roger Curtis are added. ***Copy seen:*** MH–A.

54608. SCHLOMER-JÄGER, ANNA. Alttertiäre Pflanzen aus Flözen der Brögger-Halbinsel Spitzbergens. (Palaeontographica, May 1958. Abt. B, Bd. 104, Lief. 1–3, p. 39–103, 13 plates, tables, maps.) Over 300 refs. Text in German. ***Title tr.:*** Early Tertiary plants from the seams of the Brøgger Peninsula, Spitsbergen.

Deals with fossil plants from the hanging walls of two Tertiary beds, collected in 1924–25 by Dr. Fritz Schäfer (physician at Ny-Ålesund) and later presented to the Senckenberg Nature Museum at Frankfurt a/Main. Geographic position, phylogenetic origin, age and extensive description of the plants are given. The fossils were too much decayed and decomposed for use of the maceration process, and only one species, *Taiwania schaeferi*, is directly indicated; all others by comparison. Four new species were found: *Pseudolarix septentrionalis, Acer spitzbergensis, Aesculus longipedunculus, Planera ulmifolia*, but no index fossil, therefore their Paleocene or Eocene ages left open. These finds indicate warmer climate in the Tertiary and indirectly support A. Wegener's theory of continental drift and displacement of the poles. ***Copy seen:*** DGS.

54609. SCHMERTMANN, JOHN H. A thermally controlled soil freezing cabinet. Wilmette, Ill., 1958. iv, 35 p., illus., diagrs., graphs, tables. (U.S. Army. Corps of Engineers. Snow, Ice, and Permafrost Research Establishment Report no. 50.)

"A cabinet providing good thermal control for one-dimensional heat-transfer experiments, control of water access to the sample, proper instrumentation, and adequate utility is described, together with theoretical studies and tests conducted during its development. The cabinet consists of a hinged fiber drum (18 in. wide x 18.5 in. tall) enclosing a partially demountable cylinder of Styrofoam. A coaxial cylindrical hollow (six in. wide) within the Styrofoam constitutes the sample well and is surrounded by six Variac-controlled heating tapes. A copper pan containing porous stones at the base of the sample provides water for open-system freezing and serves as a heat shield. Thermocouples are located within the sample and the Styrofoam walls. Insulator-sample heat transfer can be reduced to one percent of the heat leaving the sample by matching insulation and sample temperatures."—Author's abstract.

The heat and mass budget of temperate, arctic and antarctic glaciers in their relation to climate is discussed on the basis of the literature. The radiation absorption of a glacier surface varies strongly with grain size, porosity, free-water content, angle of incident radiation, and to a lesser degree with the spectral composition of solar radiation as dependent on cloud cover. The most significant increase in absorption, reaching values from 0.6–0.7, occurs as the snow surface begins to melt, resulting in a rapid increase in energy input and ablation. Heat transfer by air convection is at least as important as direct solar radiation in northern latitudes, and may amount to 25% of the net heat flow during ablation in the Arctic. The recent retreat of arctic glaciers and sea ice is probably related to an increase in meridional mass exchange of the atmosphere.—From SIPRE.

54624. SCHOLANDER, SUSAN. Cold fish problem; with photographs by David Linton. (Natural history, Nov. 1957. v. 66, no. 9, p. 456–67, 19 photos.)

Contains account of the *Blue Dolphin* (Comm. D. C. Nutt) expedition to Labrador under Prof. P. F. Scholander, to investigate the problem of how fish survive in water of −1.7° C., almost a whole degree below the freezing point of ordinary fish blood. Experiments carried out in a portable laboratory at Hebron Fjord, were fruitless: the fish froze on the surface at −1.7° C. but lived at the bottom of the fjord at the same temperature. The mystery was solved at Woods Hole, Mass., the following winter by a chance observation on *Fundulus:* these fish had been supercooled in the laboratory for several hours without harm, but froze when they accidentally came into contact with an ice crystal. The conclusion is drawn that supercooled fish survive in bottom waters because they never encounter ice. ***Copy seen:*** DLC.

54626. SCHROCK, V. E., *and* **R. E. GOTT.** Specific heats of aircraft engine lubricants at low temperatures. (Lubrication engineering, June 1957. v. 13, no. 6, p. 353–58, illus., table, graphs.) 24 refs. Corrected graph in no. 8 (Aug.) 1957, p. 439.

Investigation of a typical aircraft gas turbine engine lubricant (military specifications MIL–O–6081A, grade 1010), and a typical piston engine lubricant (military specification MIL–O–6082, grade 1080), showed that the specific heat of the two oils ranged from 0.38–0.56 Btu/lb. ° F. between −100° F. and 70° F., with no sharp breaks at any temperature. By interpolation of the specific heat graph, an apparent heat of fusion of 4.1 Btu/lb. was found for the piston engine oil near its pour point of 5° F. The turbine engine oil remained liquid to −100° F., specific heat decreasing with decreasing temperature, except for a small increase in the vicinity of the cloud point of −15° F.

Copy seen: DLC.

54627. SCHROCK, V. E., *and* **E. S. STARKMAN.** Thermal conductivity of aircraft engine lubricants at low temperatures. (Lubrication engineering, July 1957. v. 13, no. 7, p. 393–98, illus., table, graphs.) 28 refs.

Laboratory investigations of an aircraft gas turbine lubricant (MIL–O–6081A) and a piston engine lubricant (MIL–O–6082A) over the temperature range +80° F. to −100° F., gave an average of 0.075 Btu/hr. ° F. ft. for the first and 0.090 Btu/hr. ° F. ft. for the second. Thermal conductivity of the turbine lubricant varied linearly from 0.071–0.077 Btu/hr. ° F. ft. over the temperature range, while the piston engine lubricant showed a change in conductivity during crystallization. The thin film spherical apparatus used in the investigations, and the experimental procedure are described.

54628. SCHULE, JOHN J., *Jr.*, *and* W. I. WITTMANN. Comparative ice conditions in North American Arctic, 1953 to 1955, inclusive. (American Geophysical Union. Transactions, June 1958. v. 39, no. 3, p. 409–419, 6 maps, graph.) 8 refs.

Discusses ice conditions on the basis of recent systematic air reconnaissance. Types of ice and ice packs are distinguished. The complex East Greenland coastal ice extends to about 70° N. in Oct., in June it forms a continuous drift from the Arctic Basin to Kap Farvel. The Baffin Bay pack, confined to its region of formation, begins to form in Oct.–Nov. and attains total coverage by approx. Jan. 15; mobile ice containing great quantities of ridged and hummocked ice are predominant on the Baffin Island side. The Labrador ice stream contains sea ice contributed from the Baffin Island coast, Ungava Bay, and Hudson Strait. Of the Foxe Basin ice, previously believed to persist in a self-contained cyclonic circulation, only about 3% was found to have survived the season in 1955. Between Amundsen Gulf and Shepherd Bay total coverage is attained by late Nov.; disintegration completed Aug. 15–Sept. 15. The Bering-Chukchi pack, resembles that of Baffin Bay, attains maximum coverage in early March; disintegration (completed early in July) takes place *in situ*. The start of ice breakup and disintegration are traced to centers in icebound, far northerly regions. The origin and development of several of these "centers of sea-ice removal" are discussed. The annual variability in ice distribution and location of ice boundaries is believed to depend more on year-to-year variations in drift and movement than on the quantity of ice produced.

The mentality or thought process of Greenlanders is discussed in relation to their isolation and the severity of their living conditions. Their language, composed largely of stem words with affixed modifiers, lacking declensions or inflection, is difficult to translate. Their literature and present-day education are reviewed. Analyses are presented of the influences of observation, tradition, and ecstasy or native spiritual belief, still important in daily life, which affect their ability to adopt without reservation the western culture. Ecstasy is described as an escape mechanism common to primitive peoples in monotonous circumstances. Examples of legends and native poetry are included. ***Copy seen:*** DLC.

54631. SCHULTZ-WEIDNER, WILLY. Der Schamanismus in Sibirien. (Geographische Rundschau, Apr. 1957. Jahrg. 9, Nr. 4, p. 144–47, illus.) Text in German. ***Title tr.:*** Shamanism in Siberia.

Discusses the psychologic aspects of shamanism and holds "arctic hysteria" and other forms of polar psychosis responsible for the spirit worship of arctic and sub-arctic peoples. Far from being abstract idealizations, these spirits or "souls" tend to take possession of man or woman. Only one "possessed" and cured can gain mastery over the spirits and become a shaman with power to summon or drive away supernatural forces. ***Copy seen:*** DGS.

54632. SCHUMACHER, N. J. Some problems of meteorological observing in polar regions. (*In:* Polar Atmosphere Symposium, Oslo, 1956. v. 1, *pub.* 1958, p. 212–14.)

Contains a summary of difficulties encountered at Maudheim (71° S. 11° W.) and ways of offsetting them, of considerable validity also in the Arctic. Problems arising from drifting snow and strong radiation effects on instruments and shelter are outlined. The difficulty of reliable precipitation measurement is also noted. Effects of extreme cold on radiosonde equipment are discussed.

Bericht, 1950, *pub.* 1951. p. 44–66, tables.) 8 refs. Text in German. ***Title tr.:*** Ecological contributions to the Quaternary floral history of East Greenland.

Account of field work conducted during 1948–50 within the framework of the Danish East Greenland Expedition, headed by Lauge Koch, and covering the area between 72° and 74° N. Information is presented on the geography of the area, and its climate; Quaternary geology and climate; present vegetation, its character, ecology, etc. Detailed analysis follows of the two main aspects of the study: the early colonization of Greenland by plants and the survival of these plants during times of glacial advances. It is concluded that the present vegetation of East Greenland is the result of successive immigrations of new elements over long periods of time. The most recent, Quaternary climatic changes had only a quantitative effect upon the composition of this flora.

54640. SCHYTT, S. VALTER. Glaciological investigations in the Thule Ramp area. Wilmette, Ill., Apr. 1955. 88 p.

511326—60——65

illus., graphs, tables, fold. diagr. (*In:* U.S. Army. Corps of Engineers. Greenland ice cap research program, 1954, v. 2.) SIPRE report 28.

Results of one of two glaciological investigations, carried out by a Northwestern University Dept. of Geography party of ten, June 19–Aug. 29, 1954. Accumulation and ablation measurements were made on the Ramp (near TUTO) and further inland to Mile 20. Meteorological observations were made for correlation with the glaciological work. Accumulation on the Ramp averaged 55 cm. of snow, and varied considerably. Further inland, winter snow depths ranged from 100 cm. (Mile 4 to Mile 7), to 150 cm. (Mile 8 to Mile 14), to 100 cm. (Mile 15 to Mile 20). Below 700 m. elevation, nearly all of the Ramp was in the area with net ablation. Debris features of the moraine area are reported by B. C. Bishop; trafficability in the marginal icecap area, by R. L. Cameron and V. Schytt; ice movement and structure by A. Griscom.—From author's abstract. ***Copy seen:*** CaMAI.

54641. SCOGGAN, H. J. Flora of Manitoba. Ottawa, 1957. 619 p. plates, map, tables (Canada. National Museum. Bulletin no. 140; Biological ser. no. 47.) Refs.

Describes the physical features, climate and vegetation; vegetation regions, including in the North: the Boreal Forest, Tundra-Forest, and Tundra, their characteristic components are indicated. The systematic section presents the species and well-marked varieties, native or introduced, at present known to occur in Manitoba, with keys. Names (scientific, vernacular, common), habitat, provincial range, locality, collector and year for the northernmost and earliest collections seen, first report for Manitoba, geographic distribution, and frequently, map citations are given. Entities (204) reported for the first time as constituents, excluded species and varieties are listed. Index (Latin names) classification tables, and percentage data of circumpolar species are added. Manitoba is in a transition zone where floristic types from north, south, east and west converge. ***Copy seen:*** DGS.

54642. SCOTT, D. M., *and* **H. D. FISHER.** Incidence of a parasitic ascarid, *Porrocaecum decipiens* in the common porpoise *Phocoena phocoena* from the lower Bay of Fundy. (Canada. Fisheries Research Board. Journal, Jan. 1958. v. 15, no. 1, p. 1–4, table.) 6 refs.

Report on examinations for nematodes in 151 common porpoises and one white whale (*Delphinapterus leucas*). Only one adult *Porrocaecum* was found. Larval stages were detected in 25% of the 50 porpoise stomachs, and in that of the white whale. ***Copy seen:*** DLC.

54643. SCOTT, D. M., *and* **H. D. FISHER.** Incidence of the ascarid *Porrocaecum decipiens* in the stomachs of three species of seals along the southern Canadian Atlantic mainland. (Canada. Fisheries Research Board. Journal, July 1958. v. 15, no. 4, p. 495–516, tables, map.) 8 refs.

Based on stomach examinations of 318 harbor seals, 812 harp seals and 127 grey seals. The parasite was much rarer in the harp seal than in the two other species, where it was found practically in all stomachs. The incidence according to areas and seasons is discussed and the importance of each seal species as a vector, considered. The relation between each seal species and the incidence of larval ascarids in the Atlantic cod is also noted. ***Copy seen:*** DI.

54644. SCOTT, EDWARD MARION, 1917– , *and others.* Serum-cholesterol levels and blood-pressure of Alaskan Eskimo men. (Lancet, Sept. 27, 1958. p. 667–68, illus. table, map.) 13 refs. *Other authors:* I. V. Griffith, D. D. Hoskins, *and* R. D. Whaley.

A study of 842 subjects aged 17–53 (members of the Alaska National Guard); 80% full Eskimo, a few Aleuts (28) and Athabascan Indians included, from, altogether, 43 villages. The mean serum-cholesteral level was not found to be unusual, but there were significant

differences between men from different localities, and the northern Eskimos had higher levels than the southern. Blood pressure also showed geographic variation, though to a much lesser degree.

54646. SCOTT, H. S. The role of aerial survey methods in Canada's northward development. (Engineering journal, Nov. 1957. v. 40, no. 11, p. 1647–56+, illus.)

All Canada, including the northernmost islands, is to be mapped (at scale 1 in.: 1 mi.) within five years, by aid of air photography. Survey methods and photointerpretation for use in engineering, agriculture, forestry, also in geological and geophysical studies are described. Special applications within these fields are discussed; they include route location, materials location, hydrology and water utilization, site surveys, forest reconnaissance and inventory surveys, geological reconnaissance, geophysical surveys by use of the magnetometer, electro-magnetic and gravity methods, and radioactivity detection. An evaluation of aerial photography as applied to Canada is given. ***Copy seen:*** DLC.

Describes: Deschampsia brevifolia and *Agropyrum violaceum,* both collected by A. W. Greely in 1888, near Ft. Conger on northeast Ellesmere (81°44′ N.), the first known also from Alaska. *Phippsia algida,* hitherto known only from Alaska, is now located near Chicago Lake, Colorado. ***Copy seen:*** DLC.

54650. SCURR, K. R. Insulated forms keep concrete construction active through winter. (Contractors and engineers, Oct. 1957. v. 54, no. 10, p. 90–93, illus.)

A method of winter concrete curing developed and used successfully in South Dakota is described. The method consists of using concrete introduced into forms that are insulated by double balsam or equivalent blankets at about 65° F. The results of several tests using this method and diagrams illustrating the method are given. The findings generally indicate that the improved insulating materials and techniques permit low-temperature quality concreting without a prohibitive price penalty.

Text in Russian. Summary in English. ***Title tr.:*** Comparative-ecological analysis of the tundra and taiga faunas.

A study based on conditions in mammals and birds. It was found that the faunal composition is determined by ecological conditions rather than by historical factors. The main obstacle to penetration of taiga forms into the tundra is the lack of trees in the latter. Trees serve nesting and are a source of food. The "carnivorous" character of the tundral bird fauna is partly due to this absence of trees and partly due to the proximity of the sea, a source of animal food. ***Copy seen:*** DLC.

Notes a specimen of Greenland falcon seen on spring migration, near Porvo in South Finland (ca. 60°24′ N. 25°40′ E.) on Apr. 30, 1951. ***Copy seen:*** DA.

54665. SEGERSTRÅLE, SVEN G. The distribution of glacial relicts in Finland and adjacent Russian areas. Helsingfors, 1956. 37 p. 10 maps incl. 1 fold. (Finska vetenskaps-societeten. Commentationes biologicae, t. 15, no. 18.) 103 refs.

Contains a survey of relicts confined not only to marine areas but also to lakes (*Pallasea*), such as the ringed seal (*Phoca hispida*), a fish, *Cottus* (*Myoxocephalus*) *quadricornis*, and seven species of crustaceans. Historical notes and data on the distribution and frequency of the relicts (text maps 1–9) are followed by extensive lists of Finnish and Russian fresh-water and marine localities: in Kola Peninsula and eastern Karelia, the Gulfs of Bothnia and Finland, the White Sea. Appended is an index of the localities (249) shown on the fold. map. ***Copy seen:*** DLC.

54666. SEGERSTRÅLE, SVEN G. The freshwater amphipods, *Gammarus pulex* (L.) and *Gammarus lacustris* G. O. Sars, in Denmark and Fennoscandia; a contribution to the late- and post-glacial immigration history of the aquatic fauna of northern Europe. Helsingfors, 1954. 91 p. 42 illus., incl. text maps. (Finska vetenskaps-societeten. Commentationes biologicae, t. 15, no. 1.) 119 refs.

Contains a zoogeographic study of these two closely related species with extensive data on their immigration history and ecological aspects of distribution and immigration. "The following main conclusions were arrived at: *G. lacustris* has belonged to the fauna of Scandinavia since the last interglacial epoch at least: it survived the last glaciation in coastal refuges of Fennoscandia and since the waning of the ice-sheet had spread from this area far into the interior . . . Dispersal is mainly brought about through the intermediation of waterfowl. In contrast to *lacustris*, *pulex* did not survive the glacial age in Northern Europe. The species immigrated into this area from the continent, following the retreating margin of the ice-sheet; it lived in the ice-dammed lakes in northern Germany and was effectively dispersed by them and the subsequent fresh-water stages of the Baltic, invading many areas not reached by *lacustris*." (p. 77–78). *G. lacustris* is known from almost all Norway and adjacent parts of Sweden north of 62° N., Finland north of 66° N., and the Murman coast. *G. pulex*, entirely absent in Norway, occurs in southern Sweden and in Finland up to 66° N. ***Copy seen:*** DLC.

54667. SEGERSTRÅLE, SVEN G. On the immigration of the glacial relicts of northern Europe, with remarks on their prehistory. Helsingfors, 1957. 117 p. illus., maps. (Finska vetenskaps-societeten. Commentationes biologicae, t. 16, no. 16.) 157 refs.

Immigration of eight relict aquatic faunal species into northern Europe after the ice age is studied: ringed seal, a fish and six crustaceans, all fit for adaptation to life in fresh water. Their introduction from either west or east via brackish or saline waters during depression and partial flooding of northern continental areas is rejected. Most of the species are derived from forms inhabiting arctic marine waters of Eurasia; one amphipod, *Pallasea quadrispinosa*, may be derived from a Lake Baykal ancestor. Harbored in an ice-dammed lake in the Upper Onega valley as the icecap advanced, these relict species spread, when it waned, over wide areas from Denmark to Kola Peninsula. The mode of this spread is treated in detail. The literature on glacial conditions, flooding, and water salinity is reviewed. No definite conclusions are drawn because the actual course of events in late-glacial time is so imperfectly understood. Distribution of the eight species was considered in No. 54665. ***Copy seen:*** DGS.

54668. SEIBERT, RICHARD ALBERT, 1913– , *and* P. BROOKS. The biochemistry of tissue trauma; the effect of cold injury on muscle protein in rabbits. Randolph AFB Texas, May 1957. 4 p.

illus., tables. (U.S. Air Force. School of Aviation Medicine. Report no. 57–95.) 6 refs.

Report on the amount and composition of myosin extractable from frozen and control muscle. The composition was found to remain the same but the amount decreased considerably after freezing. Seven ways of treatment tried (including fast and slow rewarming) had no effect on the amount of myosin recovered.

54669. SEISKARI, PERTTI, *and* **J. KOSKIMIES.** Ecological evidence of racial divergence in the capercaillie, *Tetrao urogallus* L., in Finland. Helsinki, 1955. 11 p. maps, diagrs. (Suomen riistanhoito-säätiö: Finnish Foundation for Game Research. Riistatieteelisiä julkaisuja: Papers on game research, 16.) 18 refs.

Two populations of this large grouse occur in Finland, distinct in many ecological respects. The boundary between them coincides with the general ecological barrier running diagonally northwest-southeast across the country at about 64°–65° N. Environmental conditions differ in the two regions, and the differences between the two grouse populations represent, perhaps, direct reactions to environment, including the effects of latitude. But the distinct and well-defined regionalization found in some ecological characteristics, such as feeding on grain fields, feeding on aspen leaves and roosting in the snow, can hardly be understood without assuming that the populations are genetically different and form two ecologically divergent races.

54670. SEITH, ROBERT T. Testing multiwall bags at low temperatures. (*In:* U.S. Quartermaster Food and Container Institute for the Armed Forces, Chicago. Low temperature test methods and standards for containers, 1954. p. 93–99.)

Results of some early low-temperature tests conducted on multi-wall bags for cement packaging are reviewed. Increasing the number of plies of paper does not eliminate breakage of container, which appears to be due to an increase in brittleness brought about by dehydration at low temperatures. Reinforcement of the papers with materials not affected by low temperatures seems indicated.

Contains systematic and ecological notes on two species of bird-cherrry: *Padus racemosa,* growing in northern European U.S.S.R. (Kola Peninsula and Arkhangel'sk province) and western Siberia; and *P. asiatica* replacing *P. racemosa* in eastern Siberia. Both species reproduce from seed and in vegetative way. The mechanism of vegetative reproduction by so-called supporting lateral branches is described in detail. ***Copy seen:*** DLC.

54672. SELLAEG, JOHANNES, 1894– . Selfangstnaeringen. (Polarboken 1958, p. 138–57.) Text in Norwegian. ***Title tr.:*** The sealing trade.

Presents a general survey of this industry in Norway, its development, distribution of the (mainly harp and hooded) seals, the sealing-grounds (the White Sea, Svalbard area, Jan Mayen area, Denmark Strait and Newfoundland), types of ships used, shipwrecks. Protective regulations are outlined: utilization of by-products is discussed. Profits during the period 1947–1956 had an average annual value of 13.3 million Norw. kr.: 244,000 animals. Negotiations and agreements concerning sealing are discussed and details given on agreements with the U.S.S.R. The industry's future is considered: the problems include closure of the White Sea, possible extension of the fishing limit and too heavy taxation of stocks. ***Copy seen:*** SPRI.

Two sketches of present-day life in Chukotka, the first in the form of a novel, *Chukotka* (p. 9–344) tells the story of the boarding school for Chukchi children started at Lavrentiya Bay in 1928: the teachers' arrival, the parents' distrust, the first steps in acculturation: changing the children's food, clothing, habits; the teaching, with the teachers' difficulties increased by ignorance of the native language. The hospital, movie, radio station, and the rising economic and cultural level generally, profoundly affect life in Chukotka. A major factor is the Northern Machine Hunting Station, lending motor boats and schooners to walrus hunters. Cf. No. 15728, first part of this novel.

The second sketch, Adventures of Aĭvam (p. 345–89) is the story of a Chukchi school boy who was driven out to sea on a piece of shore ice, and was supplied with necessities by aircraft for several months till rescued by the helicopter of a high latitude expedition.

Brief sketch of the economic and cultural development of Chukotka and the education of Chukchi teachers is given in the author's foreword (p. 3–8).

54701. SERGEEV, MIKHAIL ALEKSEEVICH. Malye narody sovetskogo Severa. Magadan, Magadanskoe knizhnoe izd-vo. 1957. 156 p. Approx. 30 refs. Text in Russian. ***Title tr.:*** Small peoples of the Soviet North.

Informative review of the material and spiritual culture of the aborigines of (in turn) north Siberia, the Far East and the extreme Northeast, arranged (p. 13–89) by topics, viz: the economy, i.e., land and sea hunting, fishing, reindeer herding, dog breeding; way of life; social organization; spiritual culture, including religious beliefs, shamanism and animism, folklore, legal concepts, medical lore and taboos, arts and crafts, etc. National development and socialist reconstruction are treated in two periods, 1918–1930, 1930–1955; and the establishment and organization of national-territorial districts involving collectivization, administration, schooling, etc., are outlined (p. 90–155). Information on ethnic distribution and vital statistics (1926 census), is given in preface (p. 3–12) together with the former and Soviet names of the aboriginal groups, inhabiting both the European and Asiatic North. ***Copy seen:*** DLC.

54702. SERGEEV, MIKHAIL ALEKSEEVICH. Pushnoĭ promysel i olenevodstvo. (Okhota i okhotnich'e khozi͡aĭstvo, Mar. 1958. god 4, no. 3, p. 16–18, illus.) Text in Russian. ***Title tr.:*** Fur-animal hunting and the reindeer husbandry.

Discusses problems of reindeer breeding and use based chiefly on author's experience in the collective farm "Pobeda" in the Tomponskiy District of Yakut A.S.S.R. Various systems of organizing teams of herdsmen are noted. Reindeer are used for transport on hunting trips (wolves, squirrel and other fur animals) in Yakutia and other tundra and taiga regions. ***Copy seen:*** DLC.

54703. SERLAPOV, S. T. Osobennosti sinopticheskikh proti͡sessov v period raboty vysokoshirotnoĭ vozdushnoĭ ėkspediti͡sii 1956 g. (Problemy Arktiki, 1958. vyp. 3, p. 47–51, maps.) 4 refs. Text in Russian. ***Title tr.:*** Features of synoptic processes during the work of the High Latitude Aerial Expedition in 1956.

In April–May 1956, a large stationary anticyclone remained over the North Pole causing clear, calm weather in the whole arctic area, interrupted only in May 4–14 by intrusion of cyclones from the Canadian Archipelago and Laptevykh Sea. Analysis of meteorological data reveals that the prevalent type of atmospheric circulation was (according to G. I͡A. Vangengeĭm's classification) W (Western) in March, E (Eastern) in April, and E and C (Central) in May, while the high pressure area grew vertically from near surface in April to a high column penetrating the entire troposphere up to the tropopause or even to lower part of stratosphere. Conclusion is reached that the W→E→C sequence of circulation types is favorable for stability of weather in the Arctic Basin and adjacent areas. Frequent fog observed in the region south of drifting station North Pole-6 (set up in April in 76°10′ N. 178° W.) was attributed to evaporation of a polynya covering 100 km.^{2} north of Vrangel Island. Synoptic maps of arctic and northern areas show distribution of atmospheric pressure in April and May (p. 48–49) and of mean monthly air temperature (p. 50). ***Copy seen:*** DLC.

54704. SERNING, INGA. Lapska offerplatsfynd från järnålder och medeltid i de svenska lappmarkerna; med numismatisk bilaga utarb. i Kungl. Myntkabinettet under medverkan av Vera Jammer [et al.]. Stockholm, H. Geber, 1956. 222 p. 65

plates (1 col.), map. (Nordiska museet: Acta Lapponica, 11.) Text in Swedish. Summary in English (p. 161–71, 216–18). ***Title tr.:*** Lappish offering-place finds from the iron age and the Middle Ages in Swedish Lapland; with numismatic appendix prepared in the royal treasury under direction of Vera Jammer et al.

Reports on eleven offering places of the tenth- to twelfth centuries located from the Torneträsk region south below Umeälven. The excavated objects, metal ornaments, coins, arrowheads, bones, etc. are analyzed and individually cataloged, with illus., date, and geographical identification. The fabricated objects are from Scandinavia, Finland, Russia, northwest Europe, the eastern Baltic region, and from native Lappish sources. The commercial and political history, colonization, and trade routes of the region are reviewed. The importance of the fur trade when these offering places were used, and the improved economic status of the Lapps are indicated by the finds of jewelry and coins from the trading countries. Sacrificial practices and offerings changed with time and decreased as the Christian religion became adopted among the Lapps. ***Copy seen:*** DLC.

54705. SERNING, INGA. Några reflektioner kring lapska offerplatsfynd och lapsk förkristen religion. (Norrbotten. Norrbottens läns hembygdsförening. Årsbok 1957. p. 15–33, illus., map.) Text in Swedish. About 25 refs. ***Title tr.:*** Some reflections on finds at Lapp sacrificial sites and on Lapp pre-Christian religion.

In the Lappish religion, animistic and polytheistic under the influence of neighboring peoples, sacrifice played a great part. Iron-age and mediaeval finds from some ten sites are described and their significance discussed: bone, horn, etc. from animals like reindeer and bear, arrow points, pendants of different shapes and material, some for personal adornment, others attached to magic drums, etc. Cross-shaped pendants are discussed; some may have reached the Lapps through Russian and Karelian fur traders, others perhaps connected with early christianization. The Swedish Lapps were converted during the 17th and 18th centuries. ***Copy seen:*** SPRI.

54706. SERNING, INGA. Några stenåldersfynd från Norrbotten. (Norrbotten. Norrbottens läns hembygdsförening. Årsbok 1957. p. 38–42, illus.) Text in Swedish. 9 refs. ***Title tr.:*** Some stone age finds from Norrbotten.

Describes and discusses three finds, given to the Norrbotten museum in 1957: an axe, an arrow point and a dagger. ***Copy seen:*** SPRI.

"The effects of snow cover on heat exchange in the ground are discussed on the basis of measurements at Koltushi (Leningrad Province) in the winter of 1954–55. Temperatures were measured on the surface of bare and snow-covered ground, on the snow surface, and at depths of 20 cm. Monthly heat losses on bare surface varied from 0.302 kg. cal./sq. cm. in Jan. to 0.012 kg. cal./sq. cm. in March, and diminished greatly under a snow cover 20 cm. deep. Heat losses during the period Jan. 18–30 were 13.8 cal./sq. cm. on a snow surface, 185 cal./sq. cm. on a snow-free surface, and 105 cal./sq. cm. at a depth of 20 cm. in bare soil."—SIPRE. ***Copy seen:*** DLC.

54708. SERSON, PAUL H., 1924– , *and others*. A three-component airborne magnetometer. Ottawa, Queen's Printer, 1957. 97 p. illus., diagrs., tables. (Canada. Dept. of Mines and Technical Surveys, Dominion Observatory. Publications, v. 19, no. 2) 13 refs. *Other authors:* S. Z. Mack, *and* K. Whitham.

Detailed description of a magnetometer designed and built at the Dominion Observatory 1951–1955, and discussion of survey results, obtained from approx. 400 hrs. of flight in 1953–1955. Comparison is made with airborne magnetometers developed in the United States and Great Britain; reliability of this instrument is considered satisfactory, and its accuracy sufficient for production of large-scale magnetic charts. Main source of trouble in the equipment was the gyroscopes; most important source of error is in navigation; error may be reduced by use of aerial photography.

Text in Russian. ***Title tr.:*** The present state of knowledge of Quaternary glaciation. Paper delivered at the Conference on the Quaternary period held in Moscow Jan. 13–16, 1953.

The opinions of I. G. Pidoplichko and P. S. Makeev, who challenge the validity of the glacial theory and who represent "aglacial" or "antiglacial" drift theories, are discussed; and arguments are presented against them. The metachronism theory backed by I. P. Gerasimov and K. K. Markov and the synchronism theory concerning glaciation are reviewed. V. I. Gromov's monoglacial theory based mainly on Quaternary mammals, is compared with the polyglacial theories supported by the writer, S. A. Tsakovlev, A. Penck, and others. Cosmic and astronomic theories and those of Wegener and Milankovich are considered unsuitable and contradictory to established facts. The following questions on glaciation are treated: Pre-Pleistocene glaciation, history of flora and fauna in connection with climate changes, origin and development of tundra. Appended are questions and answers rising from the discussions.

54739. SHARP, ROBERT PHILLIP, 1911– . The latest major advance of Malaspina Glacier, Alaska. (Geographical review, Jan. 1958. v. 48, no. 1, p. 16–26, 4 illus., 2 text maps.) 13 refs.

Field data, obtained summers 1949, 1951, 1953, in connection with other studies indicate that Malaspina reached the limit of its latest advance 200±50 yrs. ago. Effects of subsequent melting and retreat are shown by deposition of a mantle of ablation debris, by development of dense vegetation on a marginal zone underlain by 50–150 ft. of ice (map), and by uncovering of forest debris once overridden by the glacier. Discovery of these wood fragments in the glacial till may have bearing on Pleistocene chronology. Estimated date for the climax of most recent advance of Malaspina Glacier is consistent with other Alaskan glaciers' history. ***Copy seen:*** DGS.

54740. SHARP, ROBERT PHILLIP, 1911– . Malaspina Glacier, Alaska. (Geological Society of America. Bulletin, June 1958. v. 69, no. 6, p. 617–46, illus., plates, diagrs., graphs.) 64 refs.

Describes the piedmont ice sheet covering approx. 850 sq. mi. of the southern Alaska coastal foreland along the north shore of the Gulf of Alaska (59°52′ N. 140°30′ W.). The regime, structural features, and flow of the glacier are discussed in detail on the basis of the literature and surveys from 1951–54. "The system showed marked deficits in six out of nine years 1945–1954. The ice is 2,000 ft. thick and lies in a basin at least 825 ft. below sea level. An extensive system of radial crevasses, a

prevailing foliation (with a dip of 75°–80° near the glacier center), and two sets of tight joints are consistent with the form and stresses of the sheet. Surface folds seem to have been caused by slip folding or flowage, and the ice flows uphill across the coastal foreland by folding accordion-fashion. Movement at the bottom of a 1,000-ft. borehole was 5.75 ft./yr. less than at the top, while the differential in the upper 300 ft. was 1.5 ft./3 yr. with a similar velocity distribution. The shear-strain rate seems to vary linearly with depth. The motion appears to involve basal slip or boundary-layer flow and internal flow. Surfaceward movement is required near the margin to maintain elevation and profile, and Nye's compressive flow seems the most likely mechanism to produce such movement."—SIPRE. ***Copy seen:*** DGS.

Comments on a 1955 expedition headed by Hans Christiansson, q.v. Remains of a dwelling, bath-house, smithy, etc., of Russian origin were found at Russekeila Vestspitsbergen. ***Copy seen:*** DLC.

54745. SHASKOL'SKIĬ, I. P. Skandinavskaia ėkspeditsiia 1955 g. na Shpitsbergen; otkrytie ostatkov stanovishcha russkikh pomorov xviii v. (Sovetskaia ėtnografiia, 1958, no. 4, p. 95–98.) 5 refs. Text in Russian. ***Title tr.:*** The 1955 Scandinavian expedition to Spitsbergen; discovery of remains of an 18th c. Russian Pomor camp.

Reports on the preliminary result of Christiansson's (q.v.) joint Swedish, Norwegian, Danish and Finnish archeological-ethnographic expedition which investigated the southern coast of Isfjord, Vestspitsbergen. The excavations of a Russian Pomor settlement consisting of six log-buildings, including a 5 x 5 m. main dwelling (dates 1776 and 1787 carved in a ceiling beam), a bath house, smithy and store house, are described and the artifacts found noted: work tools, fishing and hunting gear, household utensils, clothing, etc. The possibility of Spitsbergen's discovery by Norwegian or Russian fishermen prior to its "official"

discovery by Barendsz is speculated upon. The island is well-suited to have been the habitat of the "arctic paleolithic" hunter, with its abundance of reindeer, marine fauna and flora. The retouched surface of some knife- and ax-like flints found a few km. east of Russekeila may be either man-made or attributed to frost-splitting action. A new Scandinavian expedition to Vestspitsbergen is planned for the summer of 1958. ***Copy seen:*** DLC.

Reviews development of hydroelectric power in the U.S.S.R. Technical and economic aspects are discussed; water capacities and power potentials of major rivers are outlined, including Kolyma, Lena, Yenisey, Ob', Pechora, and Severnaya Dvina. ***Copy seen:*** DLC.

54775. SHERSTNEV, N. V. Rabota shakht Pechorskogo basseĭna v novykh usloviíakh. (Ugol', Sept. 1958. god 33, no. 9, p. 3–5.) Text in Russian. ***Title tr.:*** Work in the coal mines of the Pechora basin under new conditions.

Improvements in the Pechora and Vorkuta coal mining areas are outlined; they have increased coal production during the period 1942–57 about 17 times. Obsolete machinery has been replaced and mining operations generally have been mechanized; underground transportation capacity has been increased, better ventilation and metal reinforcement of tunnels have been installed; mining has been extended under river and lake beds. Development of new coal deposits with annual production of 3 million tons is planned in the Vorkuta area with new automatic and mechanized equipment. Residential buildings providing 300,000 sq. m. of living area have been constructed with utilities (heating, water supply, sewage systems) in process, also a powerful television broadcasting center, the first in the Arctic. Production in 12 new mines has increased by 25.1% and the miners' productivity is up 30.1%.

Translated into English for the Geophysics Research Directorate, Cambridge, Mass., by the American Meteorological Society. ***Title tr.:*** Preliminary analysis of the drift of radio-beacons in arctic seas.

"The drifts of seven radio-beacons in the Kara, Laptev, and East Siberian Seas in 1955 and 1956 are analyzed, and the effects of various factors on changes in direction and speed are discussed. Data on the drifts are tabulated. Minimum current effects were observed in short-period drifts in the open sea, and sufficiently accurate calculations of drift speed and direction were made from wind data only. Increased drift speed was observed in the littoral zone where drift was along the shore. The drift in De Long Strait so far exceeded calculated velocity that a strong wind current is probably involved."—SIPRE.

(Gornyĭ zhurnal, May 1958, no. 5, p. 19–24.) Text in Russian. ***Title tr.:*** Problems in the struggle against water in the construction and development of the Severoural'sk bauxite mines.

Geological and hydrological characteristics of the large bauxite deposits "Krasnaia shapochka" (Red cap), opened in 1931 in the Vagran, Kal'ya and Saraynaya river basins (approx. 60° N. 60° E.) are described. Attention is also given to effects of accumulation of karst cavities and ponds, reaching depths of over 400 m. Various measures to reduce or eliminate water infiltration into the mine shafts are discussed, since such leaks appear under a hydrostatic pressure from 3–12 atm., particularly during spring and autumn. The gradual opening of underground mining with a system of inclined and vertical shafts is outlined, technical and economic valuations are given. The major difficulties in digging of deep shafts were encountered in construction of the drainage systems and in pumping from low levels. ***Copy seen:*** DLC.

54787. SHIMIZU, HIROMU. Determination of the resistance to air flow of frost snow layer, 3; air-flow resistance of frost mass; idealized models of ice particles. (Teion kagaku, 1956. ser A, v. 15, p. 73–79, illus., tables.) 2 refs. Text in Japanese. Summary in English.

An attempt at deducing equivalent model particles having the same specific surface as frost particles grown on cooling pipes in the laboratory, in order to study the correlation between the resistance to air flow of a frost-particle aggregate and crystal shape and size. The specific surface of the frost sample was computed from measured values of resistance and porosity. Prolate and oblate ellipsoids of revolution and two types of spheres, each having approximately the same volume as the original, proved a failure as their specific surface came out too small. To obtain the coincidence, ellipsoids or spheres much smaller in volume and much greater in number than the original particles had to be assumed.

This vessel is specially designed for supply missions to permanent British research bases in the Antarctic. It is powered by two eight-cylinder 1,040 b.h.p. diesel engines, each directly coupled to a D.C. generator. The 1,350 h.p., double-armature, reversible propulsion motor may be driven by one or both generators; propeller speed is regulated from rest to half-speed by increasing the field-strength of the generators, further speed increase is obtained by increasing the engine speed. The air-cooling system and auxiliary power plant are briefly described.

54789. *SHIPBUILDING AND SHIPPING RECORD.* Canada's arctic supply fleet. (Shipbuilding and shipping record, Aug. 21, 1958. v. 92, no. 8, p. 259.)

Notes the annual resupply of northern outposts, in 1958 by six ice-breakers, 21 cargo ships and tankers, and 120 small craft. Altogether 75,000 tons of supplies are being carried, nearly twice that in 1957. ***Copy seen:*** DLC.

54790. *SHIPBUILDING AND SHIPPING RECORD.* Cargo motorship *Elgaren* for Swedish owners. (Shipbuilding and shipping record, Apr. 18,

1957. v. 89, no. 16, p. 502–503, illus., diagrs.)

Contains brief description, with deck plans and profile, of this 7,750 t.d.w. vessel strengthened for navigation in ice.

Copy seen: DLC.

54791. ***SHIPBUILDING AND SHIPPING RECORD.*** Cargo motorship for polar service. (Shipbuilding and shipping record, Oct. 10, 1957. v. 90, no. 15, p. 466–67, illus., diagr.)

Describes briefly the ice-strengthened 3,200 t.d.w. ore carrier *Freda Dan*, built for the J. Lauritzen Lines, Copenhagen, by Werft Nobiskrug, Rendsburg, in 1957.

Copy seen: DLC.

54792. ***SHIPBUILDING AND SHIPPING RECORD.*** *Nautilus* navigation equipment. (Shipbuilding and shipping record, Aug. 21, 1958. v. 92, no. 8, p. 236.)

Three separate systems were employed on the transpolar trip: The S.I.N.S. (ship's inertia navigation system), Sperry gyro-compass equipment comprising two types of naval gyro-compass, and an aircraft-type of directional gyro from the Sperry C.11 gyrosyn-compass. The position established at the Pole by all three systems corresponded exactly. The *Nautilus* is also fitted with a Sperry automatic course- and depth-keeping control system and a Sperry celestial altitude recorder which is used to monitor the other systems. ***Copy seen:*** DLC.

54793. ***SHIPBUILDING AND SHIPPING RECORD.*** A nuclear-powered icebreaker for the U.S.A. (Shipbuilding and shipping record, June 19, 1958. v. 91, no. 25, p. 818.)

Construction of a nuclear-powered icebreaking vessel for operation by the U.S. Coast Guard is proposed by the House of Representatives' Committee on Merchant Marine and Fisheries in bill H.R. 9196, June 5, 1958. A cargo-carrier and research vessel, the ice-breaker is estimated to cost 40–60 million dollars.

Copy seen: DLC.

54794. ***SHIPBUILDING AND SHIPPING RECORD.*** Polar ships. (Shipbuilding and shipping record, Dec. 26, 1957. v. 90, no. 26, p. 832–36, illus.)

Surveys ice-breakers and supply ships engaged in antarctic activities during the International Geophysical Year, 1957–58. Previous notable achievements of the British research vessels *Endeavour* (formerly *John Biscoe*) and the new *John Biscoe*, are reviewed. ***Copy seen:*** DLC.

54795. ***SHIPBUILDING AND SHIPPING RECORD.*** Submarine navigation across the pole. (Shipbuilding and shipping record, Aug. 21, 1958. v. 92, no. 8, p. 234–35.)

Contains a brief description and evaluation of the main navigational aids for polar submarine navigation, the most important of which is inertial guidance, a dead reckoning device recently developed for military purposes. The system, fully automatic and self-contained, derives the distance traveled from double integration of acceleration instead of from integration of speed through water. Its dependence on the development of highly accurate components, gyroscopes, integrators and accelerometers, is stressed.

Brief performance and construction details are given of the Dept. of Transport's new steam-driven ice-breaker *Montcalm.* The twin-screw vessel went into service Mar. 13, 1957 operating out of the Port of Quebec. The ice-breaker is of all-welded steel construction and is equipped for the additional duties of lighthouse supply and buoy tender.

Copy seen: DLC.

54798. ***SHIPPING REGISTER AND SHIPBUILDER.*** Fine icebreakers built in Finland. (Shipping register and shipbuilder, May 1957. v. 40, no. 5, p. 6–7, illus.)

Contains a description of the machinery, equipment, and hull design of the *Kapitan* class, ice-breaker built by Wartsila-Koncernen A/B of Helsinki at its

Sandvikens Skeppsdocka. This diesel-electric ice-breaker is approx. 83 m. long, displaces 5,360 tons and has a draft of 7 m. and 10,500 hp. Twin screws are located at the bow and stern for increased maneuverability. The ship is equipped with an open upper bridge and a completely closed lower bridge fitted with electrically heated windows. Accommodations are provided for a crew of 117. A small plan and photo of the *Kapitan Melekhov* are included.

Copy seen: DLC.

54799. ***SHIPPING REGISTER AND SHIPBUILDER.*** Latest addition to D.O.T. fleet. (Shipping register and shipbuilder, Apr. 1957. v. 40, no. 4, p. 21, 34, illus.)

A description (with illus.) is given of the Canadian ice-breaker *Montcalm* built by the Davie Shipbuilding Co., Lauzon, Que., and launched Oct. 23, 1956. The vessel is of all-welded steel construction, has twin propellers, and is powered by two marine steam reciprocating engines. The single-deck type vessel complies with Lloyd's 100 A.I. Class specifications. Overall length exceeds 201 ft., beam 48 ft., and draft 16 ft. A photo of the ice-breaker is included.

Copy seen: DLC.

54800. ***SHIPPING REGISTER AND SHIPBUILDER.*** Mid-Canada operations. (Shipping register and shipbuilder, Apr. 1957. v. 40, no. 4, p. 7, illus.)

More than 40 Canadian Dept. of Transport landing-craft were used during the 1956 season to unload more than 45,000 tons from vessels to Mid-Canada assembly points in the Hudson Bay area. The shallow approaches required the larger vessels to anchor one–twelve mi. from shore. Some of the unloading operations are illus. ***Copy seen:*** DLC.

54801. ***SHIPPING REGISTER AND SHIPBUILDER.*** Operations on the Pacific coast: icebreaker for West Coast. (Shipping register and shipbuilder, May 1957. v. 40, no. 5, p. 17.)

Announces construction of a new Canadian icebreaker to be assigned to Western Canadian Arctic duty during the navigating season, the first Government ice-breaker so assigned. The new vessel will be powered with twin-electric propulsion motors delivering a total of 4,250 shp. A helicopter deck is carried near the stern. The vessel will be employed for lighthouse supply and buoy tender outside the navigating season.

Copy seen: DLC.

54802. ***SHIPPING REGISTER AND SHIPBUILDER.*** Report on Hudson Bay route. (Shipping register and shipbuilder, May 1957. v. 40, no. 5, p. 8, 30, illus.)

Contains a brief report on 1956 shipments through Churchill and the outlook for 1957. Record traffic was reported in 1956 and an even larger volume of wheat is expected for 1957. Mineral development (International Nickel Co.) at Moak and Mystery Lakes and power development at the Grand Rapids on the Nelson River will affect the entire northern Manitoba economy, as well as the Hudson Bay Railway. Previously the Railway and port were used almost entirely for grain; increased shipments may eliminate the annual operating deficits. A photo of the port shows three ocean freighters loading at the Government grain elevator.

Copy seen: DLC.

54803. ***SHIPPING REGISTER AND SHIPBUILDER.*** Super ice-breaker from Davie yards. (Shipping register and shipbuilder, May, 1957. v. 40, no. 5, p. 22.)

A brief description is given of Canada's largest ice-breaker to be built by Davie Shipbuilding Co. at Lauzon, Que. The ocean-going ice-breaker is designed to have a cruising radius of 20,000 mi. at a speed of 10 knots, and to cruise a full arctic season without resupply or refueling. The vessel will be powered by diesel-electric engines, equipped with three propellers aft, and is expected to develop 18,000 brake hp. It is to be equipped with a helicopter hangar and flight deck. Specifications include overall length of 315 ft. and draft when loaded of 28 ft.

Copy seen: DLC.

54804. ***SHIPPING WORLD.*** Experimental ice channel. (Shipping world, Apr. 9, 1958. v. 138, no. 3380, p. 371, illus.)

Notes use of the Atlas Copco system to keep a 7,000-yd. channel in Lake Mälaren, Sweden, ice-free during the winter. A 100 h.p. compressor forces air through a 4-in. perforated polythene pipe laid on the bottom of the lake; the warmer bottom water starts circulating, rises to the surface, and melts the ice. Reviewed

(in Russian) by Z. Martynova in *Morskoĭ flot*, Sept. 1958, p. 24.

Copy seen: DLC.

54805. *SHIPPING WORLD.* Three recent icebreakers; vessels built for Scandinavian governments. (Shipping world, June 30, 1954. v. 80, no. 3183, p. 655–57, illus.)

Notes role of ice-breakers in merchant marine of countries on the Baltic Sea; their construction activity, etc. Three locally-built icebreakers are described and illus.: the Swedish *Thule* (profile cross-section), the Finnish *Voima*, and the Danish *Elbjørn*. ***Copy seen:*** DLC.

54806. SHIPTON, ERIC EARLE. The true book about the North Pole. London, Frederick Muller, 1957. 144 p. illus., maps.

54807. SHISHKANOV, G. F., *and* V. D. MATVEEV. K voprosu o zalozhenii fundamentov na promorozhenoe osnovanie. (Khabarovskiĭ institut inzhenerov zheleznodorozhnogo transporta. Trudy, 1956. vyp. 9, p. 77–86, illus., tables, diagrs.) 6 refs. Text in Russian. ***Title tr.:*** Laying foundations on frozen ground.

Describes experiments by the Khabarovsk Institute of Railroad Transport with foundations on ground frozen to 1.7 m. Physical processes in frozen ground are discussed, also effects of soil moisture and granulometric composition, speed of ground freezing, and depth of ground water on moisture migration, ice formation, and changes in the mechanical properties of the frozen ground. The investigations showed that intense moisture migration and ice formation are confined to the upper 0.5-m. layer; foundations can be laid on frozen sand and gravel, and also on sandy loam and silty clay soils when their moisture is below the plastic limit.—From SIPRE. ***Copy seen:*** DLC.

54808. SHISHKIN, ALEKSANDR ALEKSANDROVICH. Zadachi v oblasti povysheniîa kachestva zimnego kamennogo stroitel'stva. (Stroitel'naîa promyshlennost', Sept. 1957. god 35, no. 9, p. 2–4, table.) Text in Russian. ***Title tr.:*** Problems in the area of quality improvement in winter brick construction.

From analysis of faulty construction, methods are recommended, and described for assembly, mortar composition, duration and temperature conditions for wall setting, etc. Special consideration is given to window and door arches, their reinforcement, particularly for northern regions, where a seven-month winter limits construction work to four or five months. Preheating of buildings and foundations on frozen ground is described; mechanical stresses of foundation and walls for temperatures of −2° to −25° C. are tabulated. The low stability of walls during thaw is analyzed in respect to their height, length and reenforcement anchors; and the sagging which takes place is related to the wall thickness, mortar composition, winter conditions, etc. Flexible or floating tie-rods, permitting free sagging, must be used to reinforce brick walls of a steel frame construction. In assembling pre-fabricated blocks, concrete slopes, boxes and other wall parts, sufficient sagging clearances must be provided. High quality can be obtained in assembly seams under severe winter conditions, with preheated mortar and very rapid work.

54810. SHISHKIN, N. I. Solîanaîa problema Evropeĭskogo Severa. (Akademiîa nauk SSSR. Izvestiîa, ser. geograficheskaîa, Jan.–Feb. 1958, no. 1, p. 102–107, map) 7 refs. Text in Russian.

Title tr.: The salt problem of the European North.

Gives data on salt consumption at present; estimates needs for the immediate future. Salt exploration possibilities are discussed for the region which includes Kola Peninsula and Arkhangel'sk province. Its present salt supply from Baskunchak and Artemovsk is expensive and inconvenient. Geologic explorations at these local sites are indicated: Tyb'yu on the upper Pechora, Koryazhma near Kotlas, and Seregovo on the right bank of Vym' River. The Seregovo (approx. 62°25′ N. 50°40′ E.) deposits are abundant, but have not been considered hitherto for development because of their high chloride and sodium content. A special lixivation method is said to have been discovered which may solve this problem. Map shows these three salt-mining sites and the distribution of fisheries and other salt-using industries.

SHITAREV, I. S., *see* Tavrovskiĭ, V. A., *and* I. S. Shitarev. Materialy po pitaniiu sobolia . . . *1957*. No. 55339.

54811. SHKOL'NIKOV, M. G. Nekotorye problemy razvitiia Angaro-Eniseĭskogo ėnergopromyshlennogo kompleksa. (Planovoe khoziaĭstvo, Jan. 1957. no. 1, p. 60–74.) Text in Russian. ***Title tr.:*** Some problems in the expansion of the Angara-Yenisey industrial power development.

Economic problems of the future in the U.S.S.R. are discussed, with emphasis on a major shift of industrial development to the east, particularly in the region of Angara-Yenisey River basins. This region has about one-third of all Soviet hydro-electric power resources and 75% of the potential coal reserves. "Cascade" developments are initiated in the upper regions of the Angara, Yenisey and Tunguska and continued down stream. In addition to water power and coal, apparently unlimited reserves of raw materials are present in this region, especially: aluminum-magnesium (bauxites, nephelines, syenite rocks) iron and non-ferrous ores, and various chemical compounds. This favorable concentration of power, raw materials and silicates naturally leads to extensive economic and technological research and industrial development. Work on various existing and proposed projects is discussed for specific localities of these river basins.

Reviews transportation and operational problems of the R.C.A.F. 408 squadron, engaged in trilateration of the Canadian Arctic Islands since 1955. In 1956 operational base was set up at Churchill, with forward bases at Cambridge Bay and Foxe (Igloolik); in 1957 main base was at Thule, North Greenland, with Resolute

511326—60——67

Bay as a secondary base. Types of aircraft employed, landing techniques, ground transportation equipment, etc. are outlined, and recommendations for future survey operations are given. The technical problems are described and results analyzed (p. 94–98). Improvements in accuracy introduced with the hiran (high accuracy shoran) equipment are discussed; experiences with the tellurometer are compared favorably with those obtained with hiran. The trilateration net established 1956–57 is mapped; the horizontal control was extended north to Lake Hazen on northern Ellesmere Island. ***Copy seen:*** DGS.

Trudy. 1957. vyp. 7, p. 74–108, illus., table.) 15 refs. Text in Russian. ***Title tr.:*** On the question of classification of ultrametamorphic rocks in general and migmatites in particular.

Presents a new classification of ultrametamorphic rocks on the west coast of Beloye More in three groups: gneisses, migmatites and anatexites. The morphologic-genetic classification of migmatites (to which main emphasis is given) is presented in a table and treated in detail. Eleven types are distinguished, characterized and illustrated. Advantages of the new classification for geologic mapping are outlined. Vein facies of ultrametamorphic rocks should be called, according to the author, ultrametagenic. This rock and stages of its transformation are discussed. ***Copy seen:*** DLC.

(*In:* Materialy po laboratornym issledovaniîam merzlykh gruntov, sbornik 3, 1957. p. 280–88, illus., tables, graphs.) 2 refs. Text in Russian. ***Title tr.:*** Experiments on the effects of freezing and subsequent thawing on clay strength.

"The effects of repeated freezing of Tertiary and Quaternary clays on their mechanical strength were studied in the laboratory at the Institute of Permafrostology to determine the shear strength and cohesion of subfoundation soils for a hydroelectric power plant. The experimental procedure and methods of measurement used are described, and data on the physical and mechanical properties of the clays as well as strength variations are tabulated. Decreased strength was associated with ice formation and deformation of the frozen ground. Strength changes were not observed when the clay froze without ice formation or moisture migration to the frozen strata."—SIPRE. ***Copy seen:*** DLC.

Results of author's investigation in 1951–55 in the central Verkhoyansk Range, and adjacent areas (63°–71° N. 124°–130° E.). Five Upper Paleozoic formations are distinguished and a new lithologic-stratigraphic division of Permian and Triassic deposits is presented, based on paleontologic characteristics (fold. table). The paleogeography of each formation is discussed extensively and summarized on maps. The sedimentation of each formation is treated, its sources, type and distribution explained. Review of recent studies by others introduces this report. ***Copy seen:*** DLC.

Description of fossil flora from collections assembled by geologists in 1945–55 from Triassic deposits in the eastern (Cape Tsvetkova), central (Fad'ya and Kuda Rivers), and western Taymyr (Uboynaya and Malaya Pyra Rivers). For each of these locations, the stratigraphy of the Triassic stratum and its horizons is outlined and the fossil flora identified and described. A stratigraphic scheme is presented for each location, and a composite scheme for the entire Taymyr. The fossil flora of the Taymyr Triassic may be compared with similar flora of Greenland, Sweden, China, and has much in common, especially, with Triassic flora of Surakan, the eastern Ural and the Nizhnyaya Tunguska region.

Geologiia Sovetskoĭ Arktiki, 1957, p. 290–312.) Text in Russian. ***Title tr.:*** Geological structure of the eastern part of the north Siberian lowland, the Lena-Anabar interfluve.

Outlines the relief, stratigraphy, volcanism, and tectonics of the region (approx. 72°–74° N. 108°–128° E.) which lies between Khatanga Bay and the Lena River. In the north it opens to the Laptev Sea and in the south it ends with the contact between Permian and Cambrian deposits. The oldest deposits of the region are the Permian, the classification as yet uncertain. Triassic deposits are best known in the Ust'-Olenek zone. Jurassic deposits are

extensive and include all three series. The Cretaceous system is represented only by lower series. Volcanic activity is noted in Permian times. Hard coal and boghead, chalky coal-bearing deposits, are of practical importance as mineral resources. Some prospects for oil are noted. This region is covered by the geological map in scale 1:2,500,000, which accompanies the volume.

Doklady, July 1, 1957. t. 115, no. 1, p. 161–63, 2 tables.) 4 refs. Text in Russian. ***Title tr.*** Preglacial continental deposits in the Khibiny, and certain problems of paleogeography.

Pre-glacial deposits in 13 localities, mostly in river valleys of central Kola Peninsula were investigated. Ancient deposits found in the Poachvum basin consist of tightly cemented breccia which

include fragments of feldspar, nepheline, aegirite, hornblende, apatite and sphene. Besides breccia, lightly cemented gravel and sandstone are also present. Chemical analysis of the cement is given (49.76 percent SiO_2). The results of granulometric analysis of breccia and degree of smoothness of its fragments are tabulated. These ancient deposits indicate that the principal elements of Khibiny relief were well developed in pre-glacial time.

54882. SIGAFOOS, ROBERT SUMNER, 1920– . Vegetation of northwestern North America, as an aid in interpretation of geologic data. Washington, D.C., U.S. Govt. Print. Off., 1958. p. 165–85, illus., 3 maps incl. fold. (U.S. Geological Survey. Bulletin 1061–E. Contributions to general geology.) 52 refs. to key map, 31 refs. to text.

Presents distribution map, 33 x 48 in., scale 1:2,500,000, of three major forest groups and some treeless vegetation types in the area from Hecate Strait to Cape Bathurst and Point Barrow; and from Great Bear Lake to St. Lawrence Island. Data were drawn from published maps and U.S. Geological Survey field reports. The most common plant communities in the interior spruce and birch forest, the coastal spruce and hemlock forest, and the treeless regions are briefly described. Vegetation is discussed as an aid to understanding of local permafrost, of Upper Pleistocene and recent fossil plants, and of ecology, geomorphology and hydrology; examples are given. Small-scale maps of the distribution of the principal tree species, and a key map showing sources of data, are included.

A study of food sources, breeding and reproduction of these birds (grouse, etc.) started in 1946 and comprising all Finland. Fluctuation in number of the fall population was found to be mainly

due to spring diet (green plants) available to the female and affecting egg laying. The fluctuation in number becomes steeper and shorter in cycle length towards the North. Experiments appear to confirm this view. Measures for prevention of numerical decrease in the field are discussed, as well as similarity of conditions for these birds in Europe.

54888. SIM, VICTOR W. Geographical aspects of weather and climate at Eureka, Northwest Territories. (Geographical bulletin, 1957. no. 10, p. 37–53, illus., graphs, maps.) 5 refs. Summary in French.

Describes weather and climate and their effects upon the Eureka meteorological station on the west coast of Ellesmere Island; based on 1948–1952 record, writer's observations May–Sept. 1955, and work of R. W. Rae (No. 25333). Temperature, precipitation, wind direction and force, and visibility are discussed both as meteorological elements and as they relate to movement within the area and to accessibility by sea or air. Surface observations were made every three hours, and twice-daily rawinsonde "runs" and pilot balloon flights were carried on. Prevailing low temperature limits outdoor activity, use of the airstrip, and the ice-free period on the sea route to Eureka. Mean annual precipitation of 2.59 inches (short record) is the lowest total of any regularly reporting meteorological station in Canada. Mean cloud cover and visibility are favorable for air navigation near Eureka in April and May, when the main airlift is flown. Worst flying weather is in September; best in April and December. Prevailing winds are from the east Oct.–Apr.; west June–Aug. Present airstrip is oriented east-west. ***Copy seen:*** DGS.

54889. SIM, VICTOR W. Geographical Branch survey on Melville Peninsula, 1957. (Arctic circular, 1958. v. 11, no. 2, p. 27–29.)

54891. SIMERL, LINTON EARL, 1911– . Water vapor permeability of sheet materials. (*In:* U.S. Quarter-

master Food and Container Institute for the Armed Forces, Chicago. Low temperature test methods and standards for containers, 1954. p. 80–91, 2 graphs, 5 tables.) 3 refs.

States problem of protecting packaged foods in long-term frozen storage against water loss from surface tissue. Its importance to the Armed Forces is noted in view of storage temperature fluctuations introduced by weather, handling, airplane transport, etc. The water vapor permeability characteristics of the food containers should be known over the temperature range from −60° to +50° F. A series of five round robin tests was made by 11 laboratories Feb. 1950–Dec. 1952, to develop standard test methods. Results, in good agreement among the laboratories, are given. The work was done primarily to develop test methods, not to rate packaging materials, and recommended procedure is outlined. Water vapor permeability of certain packaging films should be determined for temperatures of −20° and −80° F. Values for four films, flat and creased, are given for temperatures of 100° and 0° F. ***Copy seen:*** DLC.

54897. SIMONSEN, POVL. Menneskets innvandring til Nord-Norge. Tromsø. 14 p., illus., map. (Ottar, Jan. 1957. nr. 10 (1956, nr. 3.) 7 refs. Text

in Norwegian. ***Title tr.:*** The settling of man in north Norway.

Describes finds (mainly stone tools) of the Komsa, Fosna and Nøstvet cultures. Over 100 Komsa settlements are known between Alteidet (approx. 70° N. 22° E.) and Murmansk; their people are thought to have come from central Russia 10,000–6,000 years ago. The Fosna settlements (several hundred) are distributed along the coast from Varberg, Sweden, to Tysfjord (approx. 68°10′ N. 16°20′ E.). This culture originated in Poland and may have reached north Norway at about the same time as the Komsa culture. It developed into the Nøstvet culture (ca. 4,200–ca. 2,300 B.C.). Climatic conditions and the fauna at the time of these cultures is given. No finds from the old stone age have been made as yet in Troms. ***Copy seen:*** DLC.

54898. SIMONSEN, POVL. Minner om Barents i Tromsø Museum. (Polarboken 1958, p. 133–37, illus.) Text in Norwegian. ***Title tr.:*** Souvenirs of Barendsz in Tromsø Museum.

Describes finds from Barendsz' camp on Novaya Zemlya in 1596–97, based mainly on No. 51213, and gives a brief history of the expedition. The camp was discovered by a Norwegian in 1871 and more objects were found by Norwegian and British expeditions in 1875 and 1876. In all about 300 objects have been recovered, most donated to the Netherlands (the main ones listed), 28 in Tromsø Museum. The finds indicate that the expedition was well fitted out according to contemporary knowledge, but that it lacked equipment essential for wintering. ***Copy seen:*** SPRI.

54899. SIMONSEN, POVL. Ottar fra Hålogaland. Tromsø, 1957. 14 p. (Ottar, Apr. 1957. nr. 14 (1957 nr. 3).) Text in Norwegian. ***Title tr.:*** Ottar from Hålogaland.

Contains text (in modern Norwegian) of the north Norwegian chieftain Ottar's account to King Alfred of conditions in north Norway about 895. He describes the country, his agricultural and whaling activities, reindeer husbandry, taxes levied by him on the Lapps, etc., also his travels: Ottar is throught to have penetrated to Belomorsk (64°32′ N. 34°48′ E.) on the White Sea, where he encountered a people whom he calls "Bjarmer". This text is based on that in *Alfred the Great, his life and works*, 1884 which contains also an English translation. ***Copy seen:*** DLC.

54900. SIMONSON, ERNST, 1898– . Effect of local cold application on the fusion frequency of flicker. (Journal of applied physiology, Nov. 1958. v. 13, no. 3, p. 445–48, illus., tables.) 11 refs.

A study of conditions in 106 healthy, older men. Immersion of one arm in ice water produced a pronounced increase of the FFF, which was more marked at the lower brightness than at the higher brightness of the test patch. The magnitude of the blood pressure increase was not correlated to the increase of the FFF. ***Copy seen:*** DNLM.

54901. SIMPSON, CORTLANDT JAMES WOORE, 1911– , *and others*. North ice; the British North Greenland Expedition. Drawings by Ann Simpson. London, Hodder and Stoughton, 1957. 384 p. 57 illus. (8 col.), 4 maps (incl. endpapers) 2 diagrs. *Other authors:* M. E. B. Banks, J. B. Walker, A. B. Erskine, H. Lewis, G. Rollitt, P. Wyllie, R. Brooke, E. Jones, C. Bull, R. A. N. McCready, J. P. Masterton, and R. W. Moreton.

Narrative (no scientific results) by the leader of the expedition (1952–1954) to Dronning Louises Land, Northeast Greenland (76°46′ N. 24°15′ W.), and to the inland ice, with contributions by various members of the expedition, and preface by A. U. Willis, Chairman of the Organizing Committee. Chronological account deals with the leader's preliminary visits to Greenland, in summer 1950 as guest of the Danish Pearyland Expedition, and in summer 1951 as leader of a four-man reconnaissance group; organization and plans for scientific program, buildings and equipment, transport and fuel, food and clothing, etc.; establishment of the 25-man group at Britannia Sø in Aug. 1952 and airlift of equipment and supplies; sledge journey and establishment of inland ice station "Northice" (78°07′ N. 38°10′ W.) by air drop, Sept.–Oct. 1952. The autumn, spring, and summer scientific journeys (geologic, seismic, gravity surveys) along the coast and on the inland ice by sledge and "weasel" during 1952–1953, 1953–1954, are described by members taking part; also the two winterings at Britannia Sø base camp and Northice. Members of the expedition for both years (21 men in 1953–1954) are listed according to their scientific function (p. 9–10). *Appended* (p. 352–84) are descriptions of the lay-out and construction of the base huts and Northice station; food and cooking; dog

sledging; clothing and tentage; vehicles and trailers; survey of sea and air freight; survey of expenditure; glossary of Danish geographic terms with English equivalents; chronological index of main events.

54902. SIMPSON, *Sir* GEORGE CLARKE, 1878– . Further studies in world climate. (Royal Meteorological Society. Quarterly journal, Oct. 1957. v. 83, no. 358, p. 459–85, text map, 5 diagrs. 2 tables.) 13 refs.

Continuation of discussion reported in No. 37432. "The effects of changes in solar radiation on the climate of the earth are discussed with special reference to glacial phases in high latitudes and to pluvial periods which are common to the earth as a whole. The relationship between the radiation and the glacial and pluvial phases is expressed in tabular form. Adopting the chronology of the glacial and pluvial phases during the Pleistocene period, as published by K. P. Oakley, a curve of solar radiation is constructed using only the glacial phases; this proves to be a periodic curve with three complete oscillations between the beginning of the Pleistocene period and the present day. Using this radiation curve, the periods of heavy and light precipitation are determined, and compared with the pluvial periods. Three periods of heavy precipitation during the Pleistocene are indicated and a correlation of these with the observed pluvial periods in Africa is suggested."—Author's abstract.

Contains a brief survey of the fluctuations of the pine forest line in Fenno-Scandinavia since the latest ice age. At present, pine is advancing in north Finland, partly because of milder climate, also as a result of improved forestry.

Reports activities of Zhupanovskiy, Avachinskiy and Vilyuchinskiy volcanoes in Jan.–Mar. 1957. For Zhupanovskiy, its geomorphology, and previous exploration are outlined, plan and photographs given of its summit, with notes on the series of weak eruptions which began in Dec. 1956 and were observed by the author during flights on Jan. 8 and 28, 1957; the eruptions were limited to ejections of vapors and ashes. On the basis of local reports and occasional observations, Vilyuchinskiy volcano, hitherto regarded as extinct, is said to emit vapor and smoke, probably from fumaroles located at its summit.

Results of field work July 15–Aug. 5, with the glaciologists B. E. Eriksson, and G. Norling, q.q.v., with camp in the firn region of Mikka (67°25′ N. 17°42′ E.) about 1,320 m. above sea level. Regular observations of temperature, humidity, wind, and clouds were made. Procedure is described, and data collected (wind direction and velocity at 100, 300, and 900 cm. above glacier surface, mean temperatures and frequency of temperatures at 50–150 cm.) are tabulated, graphed, and compared with similar records from nearby meteorological stations to determine local climatic deviations on the glacier. Observations on melt cups in the snow are described. Weather conditions on the glacier did not deviate significantly from those of the surrounding area during low pressure, overcast sky, and steep pressure gradients, while they differed greatly with gentle pressure gradients and a low degree of cloudiness. The melt cups observed in the firn region of Mikka glacier were oval in shape with their major axes parallel and aligned in rows down glacier. The snow between the rows of melt cups formed ridges, which were steeper on their lee than on their windward sides. On days with constant wind direction, the longer axes of the melt cups were oriented at a right angle to the wind, while on days with variable winds no general direction of the melt cups was observed. ***Copy seen:*** DGS.

Discusses the problem of training hunting experts in the U.S.S.R.: the Moscow Higher School of Hunting Science (Moskovskie vysshie kursy okhotovedeniĭa), 1924–27; the Moscow Fur Institute (Moskovskiĭ pushno-mekhovoĭ institut) gives instruction; a Hunting Science section was organized in 1950 at Irkutsk University. The role of qualified hunting experts in development of the hunting industry is stressed; every district of

the far north should have an expert on hunting. ***Copy seen:*** DLC.

54918. SKARLAND, IVAR, 1899– , *and* C. J. KEIM. Archeological discoveries on the Denali Highway, Alaska. (Alaska. University. Anthropological papers, May 1958. v. 6, no. 2, p. 79–88, illus. on 5 plates.) 6 refs.

Describes two caribou killing grounds discovered in blowouts during the construction of the Denali Highway linking Mount McKinley National Park with the Richardson Highway. The Ratekin site, probably a caribou butchering ground located approx. 75 miles from Paxson, yielded various types of flaked scrapers, knives and projectile points. The Hosdy Ridge site, near Tangle Lakes, consisted mainly of refuse flakes and seems to have been a drive location used by migratory caribou hunters. No burins or retouched lamellar flakes were found in either site. Due to the blowouts' destruction of culture horizons only a vague dating of between 2,000 and 4,000 years old based on the patination of flint specimens is attempted. Resemblance is noted to material discovered in the Upper Susitna drainage area lying, as the two above-named sites, within the hereditary hunting grounds of the Ahtena Indians. ***Copy seen:*** DLC.

and Permafrost Research Establishment. Special report 22.) 5 refs.

Instrumentation, techniques, and results of tests carried out with modified weasels in the summer of 1955 as part of an 1,100-mile research expedition (Project Jello) in the Greenland icecap interior are given. Max. drawbar pull was measured together with meteorological conditions and conditions of the snow cover, including snow temperature, density, and depth of distortion due to the vehicle tracks. With this vehicle, the depth to which snow properties determine max. drawbar pull may vary 15–40 cm. No correlation was found between drawbar pull and average density to any given depth. A similar lack of correlation was found in the case of ram hardness numbers. Recommendations for future test programs are given.

Methods for computing water temperature in relation to heat balance and salinity of the water are discussed on the basis of observations made by eight weather ships from 1951 to 1955. Four ships were stationed in a region of strong warm currents, one in a weak current and the other three at the boundary of warm and cold currents. About 40,000 readings were made and analyzed by correlation of observations from the nearest pair of ships. The effects of heat exchange between air and water and convectional heat transmission to deep water were studied, and a relationship was formulated between these factors (temperature of water and air, salinity of water, heat losses from surface water, etc.). It is concluded that: (1) water temperature during winter is dependent mainly upon heat exchange between water and air; (2) with known initial temperature distribution and vertical salinity, the water temperature can be computed using the heat balance at the water surface; (3) in the absence of known distribution of temperature and salinity the depth of convectional exchange can be determined approximately using the sum of heat losses at the ocean surface. Anomalies in water temperatures may be computed by air temperature anomalies; (4) the air temperature in some cases may be computed by empirical formulas.

54950. SKUNCKE, FOLKE. Renbeten och deras gradering. 1958. 204 p., illus., map, tables, 9 diagrs. in pocket. (Lappväsendet. Renforskningen. Meddelande, 4.) About 60 refs. Text in Swedish. ***Title tr.:*** Reindeer pastures and their grading.

Presents results of author's field investigations in north Sweden. Seasonal

fodder plants and their plant communities are established, and a large number of such communities in mountain and forest regions are described. In 18, sample areas are analyzed, and weight of their forage plants, green and dried, is given. Data on annual potential fodder plant production in various types of vegetation are tabulated and graphically presented. Relationship between forestry and reindeer husbandry is treated extensively. Need for certain further investigations is shown. The evaluation of pastures affected by water-power projects is dealt with from various points of view. A survey of mountain vegetation and of the more important ecological factors regulating or affecting the composition and distribution of this vegetation is contributed (p. 36–60) by Gustaf Sandberg. ***Copy seen:*** SPRI.

54951. SLADE, DAVID H. An unusual weather disturbance near Thule Air Base, Greenland. (American Meteorological Society. Bulletin, May 1958. v. 39, no. 5, p. 278–79, text map, diagr.)

Unusual, sharply defined cyclonic eddy, about 7 mi. in diameter, composed of spiral bands of clouds with a clear "eye" in the center similar to idealized plan of a hurricane, was noted July 9, 1956, over Baffin Bay southwest of Thule Air Force Base. The eddy extended to a height of 2,700 ft., above the top of fog which covered the area. Formation and rotation of eddy were not observed but its position remained unchanged for almost an hour. Similar local phenomena are frequently found along the Greenland coast; are difficult to predict.

54954. SLAVIN, S. V. K voprosu o metodakh i formakh upravleniîa profsessom sotsialisticheskogo osvoeniîa Severa SSSR. (Problemy Severa, 1958. vyp. 1, p. 229–43, map.) 5 refs. Text in Russian. ***Title tr.:*** Methods and forms of management in the socialist development of natural resources in the North of the U.S.S.R.

Natural conditions of the Soviet North, lack of means of transportation and scarcity of population, are such that specific organizations are required for its economic development and they combine utilization of natural resources with provision of transportation facilities. Among these organizations are: Transportation, Industry and Colonization Combine of the Murmansk Railroad, founded in 1923; Stock Company Komseveroput', organized in 1928 and absorbed in 1932 into Main Administration of the Northern Sea Route; Vorkuta Combine; Ukhta Combine; Kamchatka Stock Company (liquidated in 1943); Main Administration for Construction in the far North (Dal'stroĭ), etc. In all these organizations certain administrative powers have been vested for their territory and their functions involved combined development of industry and transportation. Their activities, interrelations, and modifications are briefly outlined. ***Copy seen:*** DLC.

54955. SLAVIN, S. V. O ponîatii "Sovetskiĭ Sever." (Problemy Severa, 1958. vyp. 2, p. 253–65, maps.) 15 refs. Text in Russian. ***Title tr.:*** Meaning of the term "The Soviet North."

In contrast with the legal term "Far North" (Kraĭniĭ Sever) which is repeatedly defined in decrees of 1931, 1932 and 1945, the term "Soviet North" (Sovetskiĭ Sever), widely used in literature, has no precise meaning. It should be applied, in the author's opinion, to the least inhabited and least developed areas.

Analysis of the actual geographic, climatic, and economic conditions and status of population shows that in this meaning the Soviet North represents territory of over 10 million km.², with southern limit beginning at approx. 62° N. in the west and gradually dropping southward to 50° N. in the Far East (maps p. 260 and 262).

54965. SMAYDA, THEODORE J. Biogeographical studies of marine phytoplankton. (Oikos, 1958. v. 9, no. 2, p. 158–91, 7 illus., 2 tables.) 156 refs.

Contains data on the distribution of representative arctic, antarctic, tropical and cosmopolitan phytoplankton species, and on the accompanying temperature-salinity conditions. Both polar species, *Thalassiosira antarctica* and *T. hyalina* are stenothermal and stenohaline. *T. antarctica* is circumpolar. *T. hyalina* shows an eastern arctic tendency and has an irregular longitudinal distribution. The existence of bipolarity claimed for certain phytoplankton species is reconsidered. The different types of phytoplankton indicator species are discussed. The role of light, temperature, salinity, pollution, fertility and currents as factors of distribution is discussed.

Contains a biological account of the deep-sea prawn, *Pandalus borealis* Kr., based on activities of the Grønlands Fiskeriundersøgelser (Greenland's Fisheries Investigations) off the west coast since 1946. The prawn usually lives at 200–500 m. depth and is caught at 300–400 m.; it requires an even, soft sea-bed, a high salt content (33–35°/₀₀) and a temperature preferably over 1° C. It changes sex from male to female at age 4–5 yrs. in Greenland. Details on spawning and feeding are given. The general fauna of the prawning-grounds is described. ***Copy seen:*** DLC.

54973. SMIDT, ERIK. Rejebestande og rejefiskeri ved Grønland. (Grønland, Aug. 1957, nr. 8, p. 281–89, table, diagrs.) Ref. Text in Danish. ***Title tr.:*** Prawn stocks and prawn fisheries off Greenland.

Contains a survey of the three areas where commercial prawn trawling is profitable. Disko Bay is best with water temperatures (cf. table) favorable and stable, and no risk of exhaustion of stocks. Off Holsteinsborg are two possible trawling grounds, but temperatures are less stable, and commercial fishing was suspended there in 1949 after most of the prawn stocks were winter-killed. The stocks have recuperated, but deterioration in climate entailing their depletion is a risk. The third area is in the

Julianehåb and Nanortalik districts, the most important being Tunugdliarfik Fjord (61° N. 45°30′ W.). Year-round fishing is possible here though profitable only in winter; but it cannot be appreciably extended here without risk of exhausting stocks. Greenland prawn fishing, started in 1935, is reviewed; 526 tons were caught in 1956 and landed at the Narssaq and Christianshåb canneries.

54986. SMITH, AUDREY URSULA. Life at low temperatures. (Nature, London, Oct. 4, 1958. v. 182, no. 4640, p. 911–13.) 10 refs.

Report on joint session of sections Zoology and Physiology of the British Association held on Aug. 28, 1958. Insects, molluscs, semen and other mammalian cells, tissues and whole mammals are discussed as to their response to cooling and freezing. Hypothermia, supercooling, resuscitation, etc. are also noted. ***Copy seen:*** DNLM.

54987. SMITH, AUDREY URSULA. Problems in the resuscitation of mammals from body temperatures below 0° C. (Royal Society of London. Proceedings, 1957. ser. B, v. 147, no. 929, p. 533–44, illus.) 21 refs.

A study of resuscitation of larger mammals, rabbits and galagos (small African primates) and of the causes of their death after recovery, which was found to be due to internal hemorrhages. Also an investigation of hemorrhages in the placenta and other organs of frozen hamsters followed by an analysis of cardiac action in hearts isolated from various animals in subzero hypothermia (hamster, rat, tortoise). The latter studies showed "that the heart was not the first organ to fail when intact mammals were frozen." ***Copy seen:*** DNLM.

54988. SMITH, CHARLES H. Mapping for the Mid-Canada Line. (Photogrammetric engineering, Mar. 1957. v. 23, no. 1, p. 161–65, diagrs., port.)

The Mid-Canada Line, part of the North American Radar Early Warning System, is constructed by Canada. Siting of the radar station required a strip of 1:50,000 mapping, 15–25 mi. wide, extending across the continent at roughly the 55th parallel of latitude. The mapping was carried out by the Army Survey Establishment with assistance of other Canadian Government mapping agencies. Standard instruments and conventional methods were used: multiplex for plotting from photography up to 20,000 ft. altitudes, and Kelsh and Wild autograph equipment up to 35,000 ft. The total job resulted in 125 sheets measuring 22 x 29 in. at the required scale and 25 ft. contours. Total area mapped amounted to 38,625 sq. mi. The maps are considered adequate for any purpose requiring maps of this scale. ***Copy seen:*** DLC.

54989. SMITH, DONALD A., *and* **K. C. FISHER.** The distribution, orientation, and activities of the varying lemming in a gradient of temperature. (Canadian journal of zoology, Aug. 1956. no. 4, p. 243–61, illus., tables.) 14 refs.

Normal lemmings with furred soles did not select a portion when placed in a temperature gradient tube, but when their soles were clipped they chose a zone of 28°–35° C. This indicates that temperature selection through the soles is normally interfered with by the fur. Location and frequency of non-locomotor activities in normal animals in the tube suggest temperature perception even when temperature selection does not occur. Orientation was not pronounced except when selecting temperature.

54991. SMITH, ERNEST CHALMERS, 1912– . Anther color in willows. (American midland naturalist, Sept. 1945. v. 34, no. 2, p. 440–44.)

Contains observations on anther color (in the field and herbaria) of various willows, including some native to Alaska: *Salix arctica,* anthers almost black; *S. barclayi,* unopened anthers dark gray to almost black; *S. pulchra, S. reticulata, S. sitchensis* and *S. stolonifera,* anthers of all black. A distinctively dark color in the unopened anthers when dried suggests an original red in freshly collected specimens. Only when such correlations are established for various colors, can anther color be used effectively in the identification of herbarium specimens. Red anthers appear to be more common in species of high altitudes and high latitudes, and more pronounced in specimens exposed to strong direct light.

54997. SMITH, MARIAN WESLEY, 1907– . The cultural development of

the Northwest Coast. (Southwestern journal of anthropology, Autumn 1956. v. 12, no. 3, p. 272–94, map, charts.) 43 refs.

An attempt to reconstruct the history of the Northwest Coast by correlating archeological and ethnographic material. A common arctic and/or subarctic stratum encompassing the Asiatic and American North Pacific rim is suggested as base for subsequent arctic (Eskimo and Aleut) and northwest American (including the northern northwest coast) cultures (cf. No. 39600). Arctic climaxes are compared with parallel developments in the Columbia-Fraser area and arctic influences, with a radiocarbon date of approx. 2500 years ago, traced as far south as Vancouver Island. This paper is criticized and author's assumption for an arctic origin of the northwestern culture questioned by Wayne Suttles in: *The "Middle Fraser" and "Foothill" cultures: a criticism*, pub. in same journal summer 1957, v. 13, no. 2, p. 156–83.

55000. SMITH, R. L., *and others.* Mechanical properties of high-purity iron-carbon alloys at low temperatures. (*In:* U.S. National Bureau of Standards. Circular, May 7, 1952. no. 520, p. 153–79, illus., tables, graphs.) *Other authors:* G. A. Moore *and* R. M. Brick.

Natural stress-strain data obtained over the temperature range +23° to −185° C. on four specimens with 0.05–0.49% carbon, having microstructures with ASTM no. 4–5 ferrite grain size and pearlite of spacing equivalent to normalized steels, were analyzed. Yield points and flow stresses were found to increase with increase of carbon content and with decrease in temperature, as did fracture stresses, until at around −150° C., loss of ductility becomes pronounced and the fracture stress dropped to a considerably lower "unworked" value at −185° C. The transition temperature, based on a selected value of energy to fracture increased, but insignificantly, with carbon content. Increasing carbon content resulted in a marked decrease in total strain and energy absorbed to fracture. Comparison of data for the examined alloys with those for low-aluminum high-purity ferrites indicates that carbon reduces the ductility of iron at all temperatures in the range investigated.—From author's abstract. ***Copy seen:*** DI.

55001. SMITH, ROBERT EMRIE, 1913– , *and* **A. S. FAIRHURST.** Cellular mechanisms of cold adaptation in the rat. (Federation proceedings, Mar. 1958. v. 17, no. 1, pt. 1, p. 151.)

Summary of investigations of respiration in liver preparations from cold-adapted and normal rats. It is concluded "that the increased heat production of the cold-adapted mammal is a direct function of an altered utilization of the energy derived from oxidative metabolism." ***Copy seen:*** DNLM.

55002. SMITH, ROBERT EMRIE, 1913– . Hepatic $Q^{N}_{O_2}$ and mitochondrial number of cold-adapted rats. (Federa-

tion proceedings, Mar. 1957. v. 16, no. 1, pt. 1, p. 121.)

Contrary to the findings of others, liver tissue of rats living at an environmental temperature of 2° C. on a high protein diet showed no increase in the amount or number of mitochondria. Neither were there differences observed in other physical or chemical cell components studied. Respiration measurements likewise failed to show a significant difference in $Q_{O_2}^{N}$ between cold-adapted and control series. The possible causes for these unexpected results are discussed.

Trudy, 1957. nov. ser. t. 35, Sibirskiĭ ėtnograficheskiĭ sbornik, pt. 2, p. 3–37, diagrs.) Text in Russian. ***Title tr.:*** Materials for the analysis of socialist culture and living conditions of the indigenous population of the Chukotskiy District.

The collectivization of Chukotka, started in 1928–1930, was completed by 1952 with the creation of 18 kolkhozes. The present-day economy, based primarily on reindeer herding and seamammal hunting, is illustrated by a detailed account with statistical data (1953–54) of a Chukchi kolkhoz near Lorino (65°30′ N. 171°43′ W.) and a Chukchi-Eskimo collective farm near Chaplino (64°25′ N. 172°15° W.). Reindeer herding, summer and winter pastures and camps, herding routes, food supplies for herders, draught reindeer and dogs are described. Trade, shops, fairs and feasts, production of fur, leather and bone goods are noted. Fishing, whaling, sealing, and hunting of sea and land furbearing animals (walrus, bearded seal, polar fox, ermine, etc.) are dealt with. The main income sources of the two collective farms and the payments in cash and kind to kolkhoz members are analyzed. Housing (floor plans given), furnishings, schooling of Chukchis and Eskimos (including adult education), technical training, hospitals, and recreational activities are discussed.

55006. SMOLÎAK, A. V. Ob odnom drevnem tipe zhilishcha na severo-vostoke Azii. (Akademiîa nauk SSSR. Muzeĭ antropologii i ėtnografii. Sbornik, 1957. t. 17, p. 5–21, illus., diagrs.) 16 refs. Text in Russian. ***Title tr.:*** An ancient house type in northeast Asia.

Discusses the two predominant house types of the settled coastal Chukchis and Eskimos: the above-ground îaranga and the semi-subterranean house. Both were permanent dwellings used, respectively, in summer or winter. The coastal îaranga differs in shape and construction from the temporary, conic, hut-like îaranga of the nomad reindeer-herding Chukchis; it shows affinities to Aleut

511326—60——69

houses and to dwellings of the lower Amur region and Sakhalin Island. It was a rectangular, hexagonal or oval-shaped building covered with hides, its sloping roof resting on one, or several parallel beams. The different construction techniques of the walls (of boards or field stones) and of the wooden frame of these two house types on the Chukotka littoral are described and diagrammed. The assumption that coastal Chukchis were nomads or semi-nomads seems refuted by the permanent character of their dwellings and the continuous existence of settlements already mentioned on 17th and 18th century maps: Lorino, Uelen, etc. ***Copy seen:*** DLC.

Describes a two-unit transistorized system which, when lowered from the research vessel, plots temperature (0.05° C. accuracy) against depth (±0.25% accuracy). Depth (pressure) is measured with a vibrating-wire transducer (vibrotron), consisting of a wire placed in a fixed magnetic field and connected to a diaphragm, variation in pressure causing change of the vibration frequency (and generated voltage). 6014A transistors in a Wien-bridge oscillator circuit measure the temperature. Oscillator unit and transistor amplifier are encapsulated separately in five-in. stainless steel tubes; outputs are fed to deck instrumentation through a single-wire polyethylene-insulated cable. Signals are passed via a broad-band amplifier and separated by a high-pass and a low-pass filter before they are fed to the recording unit. ***Copy seen:*** DLC.

Bulletin, Dec. 1958. v. 69, no. 12, pt. 2. p. 1646.) Abstract of a paper presented at the Society meeting in St. Louis, Nov. 6–8, 1958.

Describes intrusives into wet semiconsolidated muds during Miocene time in the form of pillow averaging 5–10 ft. diam. and layered lava pods up to 600 ft. thick. ***Copy seen:*** DGS.

55011. SNYDER, GEORGE LEONARD, 1927– . Ocean floor structures, northeastern Rat Islands, Alaska. (*In:* U.S. Geological Survey. Investigations of Alaskan volcanoes. Bulletin, 1957. no. 1028–G, p. 161–67, 4 maps incl. 1 fold.) 5 refs.

Map (scale 1:125,000) of submarine topography near northeastern Rat Islands, just west of the 180° meridian

in the Aleutians, covers area 51°45′–52°10′ N. 180°–177°45′ E.; has 100-ft. contour interval above and below sea level, and shows caldera lakes and faults or fissures. Ocean floor contains many volcanic, sedimentary and tectonic structures, and erosional features. Number of soundings per sq. statute mi. (summarized on a text map) range from a minimum of 3–15 to a maximum of 200–300. Text identifies and describes seven types of bottom topographic features. The 35-mile long Prokhoda Scarp, between Little Sitkin and Semisopochnoi Islands, appears to be connected with a fault system on Little Sitkin (51°55′ N. 178°30′ E.). Maximum relief of the scarp is more than 1250 ft.; the west half of the ridge and scarp is apparently displaced half a mile south; considerable vertical displacement is also evident.

55012. SNYDER, LESTER LYNNE, 1894– . Arctic birds of Canada. Illustrations by T. M. Shortt. Toronto, University of Toronto Press, 1957. 10, 310 p., illus., maps. about 90 refs.

A comprehensive and informative work simple in style, in consideration of the non-specialist; well and richly illustrated, with numerous maps indicating breeding areas and range, the text aimed "primarily on recognition." Following an introductory part (p. 3–18) on the geographic scope of the work, the nature of arctic birds, list of place names, and leads (with keys) to identification, the avifauna is described in taxonomic order. Descriptions of individual species include common and native names; distribution, general and seasonal; habitat; characteristics of adult and young in the field and "in the hand." Comparisons are made with related forms; growth, migration, breeding areas, etc., are indicated. Occasional visitors from the sub-Arctic, species doubtfully or erroneously reported from the Arctic, etc., are dealt with in an appendix. For reasons explained, Labrador is excluded. A short glossary explains the technical terms.

Contains a geobotanical study of this large region (ca. 650,000 km.^{2}) with predominance of *Larix daurica;* it differs considerably from the taiga region east of the Lena River. The vegetation on watersheds and river valleys, on the Olenek-Vilyuy plateau, are characterized from the viewpoint of the history of its development. The earlier dark coniferous taiga was replaced by a deciduous taiga during the glaciation era; and its commonest representative now is the relict species, *Picea obovata.* The present-day taiga includes both elements of the more southerly vegetation of the tableland, and tundra components from the northern Khatanga-Anabar area. Thin forest vegetation covers almost all this region, its most striking feature. The ground cover consists of moss and mosslichen associations. ***Copy seen:*** DLC.

55037. SOKOLOV, V. N., *and* **G. A. ZNACHKO-ÎAVORSKIĬ.** Novye dannye po geologii Gydanskogo poluostrova. (Leningrad. Nauchno-issledovatel'skiĭ institut geologii Arktiki. Informaſsionnyĭ biûlleten', 1957, vyp. 6, p. 4–10.) Text in Russian. ***Title tr.:*** New data on the geology of the Gydan Peninsula.

Reports field investigations in the western Gydan to provide geologic mapping at the scale 1: 1,500,000. General observations are outlined, and lithologic, stratigraphic descriptions given for 20 outcrops of sand lenses found in the Sabuto-Yakha River region and in upper reaches of the Levaya Yaru-Yakha and Nyaday-Pyncha. Peculiar ranges of hills, 20–25 m. high, observed in 15 different localities are described and divided into three types. Interglacial deposits, glacial boulders are characterized. ***Copy seen:*** DGS.

55038. SOKOLOV, V. N. Rezul'taty poiskov i razvedki nefti i gaza v Ust'-Eniseĭskom raĭone. (*In:* Leningrad. Nauchno-issledovatel'skiĭ institut geologii Arktiki, Trudy, t. 92, Nefte-gazonosnost' severa Sibiri, 1958, p. 108–119, tables, map.) 12 refs. Text in Russian. ***Title tr.:*** The results of prospecting and exploration for oil and gas in the Ust'-Yenisey district.

Presents a comprehensive account of the survey for oil and gas in the area 68°–72° N. 80°–87° E. since 1935. The institutions involved, various types of survey, cost (in all about 200 million rubles), etc. are reported; 145 core drillings and 15 deep-bore test wells have been made. Eight sections have been examined: the Malaya Kheta and Tochinsk structure, Dolganskiye lakes region, Bol'shaya and Malaya Kheta interfluve, Bol'shaya Layda region and M. Kheta-Yenisey interfluve, the lower course of the Sukhaya Dudinka River, lower Yakovleva, Kazantsevskaya area, and Cape Sopochnaya

Karga. Geologic structure of Ust'-Yenisey region is reviewed, occurrence of gas on the surface and oil in deep cores is reported. Quantities, properties and analyses of samples, ground water are summarized, and some data given. The gas and oil volumes at present are not large enough to warrant production, but this region is considered a most promising area where, in Mesozoic and Paleozoic deposits, oil potentialities are certain. ***Copy seen:*** DGS.

55039. SOKOLOV, V. N. Tektonicheskoe raĭonirovanie severa Zapadno-Sibirskoĭ nizmennosti. (*In:* Leningrad. Nauchno-issledovatel'skiĭ institut geologii Arktiki. Trudy, t. 92, Nefte-gazonosnost' severa Sibiri, 1958, p. 75–94, map.) 11 refs. Text in Russian. ***Title tr.:*** The tectonic division of the northern West Siberian lowland.

Presents map and explanation of a regional tectonic division worked out by the author together with D. V. Levin and S. M. Krŭkov from a week's exploration of the area approx. 66°–74° N. 62°–88° E. Recent studies, geologic mapping, magnetic and gravity surveys were used to define its tectonic history. The predominant Precambrian, Paleozoic, Mesozoic and Cenozoic formations were primarily tectonically deformed by orogenic phases of the Hercynian and Alpine periods. Magnetic anomalies were used to identify various synclines and anticlines which are briefly characterized. Occurrence of intensive recent tectonic movements is recognized in three regions and outlined. Best prospects for oil are around Ust'-Yeniseyskiy Port.

Analysis of the historical development of Ostyak and Vogul house types based primarily on the work of U. T. Sirelius (No. 26227), the Kama archeological expedition of Molotov (Perm') University and the West Siberian expedition of the Institute of the History of Material Culture. Two basic house types, typical for both peoples, are distinguished: the frame hut and house of the semi-subterranean and above-ground varieties and the log cabin. While log cabins were probably introduced into western Siberia by the Zyryans and Russians in the 17th century, traces of frame-reinforced house pits were found in archeological sites of the third millennium B.C. The shape (round, conical, rectangular), building technique and materials (poles, logs, blocks), roofing (bark, branches, sod), size and position (sunken, above ground), use (temporary, permanent), etc., of the frame dwellings are described. The log cabins were used mainly as summer shelters; different types of log construction are sketched. ***Copy seen:*** DLC.

(Botanicheskii zhurnal, Nov.–Dec. 1955. t. 40, no. 6, p. 850–53, 22 illus., table.) 19 refs. Text in Russian. ***Title tr.:*** The size of pollen grains and the chromosome numbers of some species of arctic grasses.

Contains tabulated data on chromosome numbers and diameters of pollen grains and pores of 35 grasses, of which 21 were

collected in various arctic localities: Khibiny, Kolguyev Island, Tiksi Bight and Taymyr Peninsula. The arctic species are characterized by a high number of chromosomes (polyploids) and large size of pollen grains.

(Forskning og forsøk i landbruket, 1957. bd. 8, hefte 5, p. 329–63, tables, graphs.) 2 refs. *Also pub. as* Norway. Statens forsøksgard Løken. Melding nr. 37. Text in Norwegian. Summary in English. ***Title tr.:*** Content of nitrate and ammonia in cultivated soil with and without plant growth; preliminary investigations.

Comparative experiments were made in southern Norway and Troms (69.5° N.) on plots of organic and mineral soils during the growing season. Soil conditions, added fertilizers, and unassimilated organic matter are described. Nitrate content of soil without plant growth reached late spring and fall peaks. The fall peak was absent in soils with plant growth. In Troms it stayed as high as in southern locations, even with lower temperatures. Except for a bogland experiment and soon after fertilizing with sulphuric ammonia, very little ammonia was found. Graphs and tabulated data are included for individual plots.

(Meddelelser om Grønland, bd. 155, nr. 2.) 49 refs. Text in German. Summary in English. ***Title tr.:*** Geology of Lyells Land, northeast Greenland.

Discusses stratigraphy and tectonics of part of the Caledonian mountain chain of East Greenland, on the Lyells Land peninsula (72°40′ N. 25°30′ E.). This area, investigated by the author during the Danish Expedition to East Greenland led by L. Koch, contains gneisses of the central metamorphic complex in the west, and sediments of the Eleonore Bay and tillite formations in the east. The sedimentary sequence is described in detail, also the tectonic features including the E–W depression, the N–S folds and faults, the NW–SE striking tension faults, the Narhvalsund depression, the eastern marginal flexure, and the major fault parallel to it.

Reitzel, 1957. 54 p. illus., plates, maps, profiles, diagrs. (Meddelelser om Grønland, bd. 160, nr. 2.) 20 refs. Text in German. Summary in English. ***Title tr.:*** Geological investigations of the Precambrian sediments: between Grandjean Fjord and Bessel Fjord, 75°–76° N. lat., in northeast Greenland.

Describes stratigraphy and tectonics of sediments extending northwest from the southernmost part of Hochstetters Forland to the interior of Bessel Fjord, as investigated during the Danish East Greenland Expedition led by L. Koch. The sediments belong to the Eleonore Bay formation, and are assumed to be preserved in a NW–SE directed graben. In many places, they are intruded by granites probably related to the late- to post-orogenic granites of the Caledonian areas further south. Two main directions of tectonic axes have been distinguished: an older system running NNE–SSW, and a younger directed NW–SE. It is assumed that most of the tectonic features result from the Caledonian orogeny. In southern Hochstetters Forland, faults believed to be of Caledonian origin were reactivated in Mesozoic or post-Mesozoic times.

55090. SPENCER, ROBERT FRANCIS, 1917– . Eskimo polyandry and social organization. (International Congress of Americanists, 32nd. Copenhagen, 1956. Proceedings, 1958, p. 539–44.) 29 refs.

Discusses various kinds of polyandry (fraternal, kinsmen, non-kin partnership, etc.) and its causes, especially female infanticide. True (permanent) polyandry based on economic cooperation and the practice of short-term wife-lending are differentiated, and Eskimo polyandry adjudged the latter. This apparent polyandry is fairly common among the Netsilik, known to the Copper, other Central and North-Alaskan Eskimos; it is rare in Greenland. ***Copy seen:*** DSI.

55091. SPINNANGR, FINN. Some remarks on precipitation measurements at sea. Oslo, H. Aschehoug, 1958. p. 123–42, 4 text maps, 5 tables. (Norway. Meteorologiske institutt. Meteorologiske annaler, bd. 4, nr. 7.) 4 refs.

Compares precipitation measurements at Thorshavn in the Faeroe Islands with those on Ocean Weather Station M (66° N. 02° E.). Differences in exposure of gauges are noted. The synoptic situation is described, with maps, on ten dates in 1955–1956, emphasizing smaller amount caught at Station M, one-fifth to one-third that caught at Torshavn and other land stations. Station M measurements probably represent about half the actual amounts at that point. Precipitation measurements at an ocean weather station, are of doubtful value; those on a moving ship, of little value except to climatology. ***Copy seen:*** DWB.

Summary in English. ***Title tr.:*** Stratigraphy and facies of the sedimentary volcanic cover of the Siberian platform.

Six tectonic periods are distinguished in the development of the Siberian platform cover, overlying predominantly Archean and Proterozoic rocks; and the stratigraphy and distribution of sedimentary and volcanic formations are

511326—60——70

outlined. All of the later geologic systems are represented in development of the cover materials. Most complete are Sinian, Cambrian and Ordovician deposits and in less degree Silurian, Devonian, Carboniferous, Permian, Triassic, Jurassic and Cretaceous. Paleogene and Neogene have only limited distribution. The accumulations are chiefly carbonates from Sinian to Lower Carboniferous, and terrigenous after the beginning of the Permian. Signs of oil are noted in Cambrian, Permian, Triassic and Jurassic sediments.

55110. STANKEVICH, E. F. Ob otnositel'nom znachenii vechnoĭ merzloty i rastitel'nosti v obrazovanii rel'efa ravninnykh tundr. (Vsesoîuznoe geograficheskoe obshchestvo. Izvestiîa, Mar.–Apr. 1958. t. 90, vyp. 2, p. 178–80.) 17 refs. Text in Russian. ***Title tr.:*** On the relative roles of permanently frozen ground and vegetation in the formation of tundra plain relief.

The assumption (as expressed by A. G. Grigor'ev, No. 6214) that permafrost retards normal relief development on the watersheds of the Bol'shezemel'skaya Tundra is challenged. The major role in soil and relief conservation is attributed to the vegetation cover. Characteristics of this tundra relief are analyzed: the surface is older than its relief development indicates; the existence of a closed plant cover has acted as a brake on the erosional processes; a widespread blanket of turf acts to sustain the existing relief; the length of summer and its precipitation are insufficient to allow development of erosion. The frozen ground itself has no influence on conservation of relief. An evaluation of the literature on the problem is included. ***Copy seen:*** DLC.

Text in Norwegian. ***Title tr.:*** On a north Norwegian keel; Vesteraalen Steamship Company during 75 years, 1881–1956.

Jubilee publication presenting an historical review of the Company, together with a survey of the development of sea communications in northern Norway. Conditions along the coast in the 19th century, especially the fishing industry, are described. Local facilities for shipping and travel and a postal service were in urgent demand and a steamship company was formed in 1881 by individual subscription in the Vesteraalen region. This company has remained the chief communications system of northern Norway extending to Spitsbergen. Outstanding individuals and their parts in the company's activities are treated in detail. Administration, finances, company ships, pertinent national laws and economic conditions are outlined; and the development of shipping facilities along the coast are traced chronologically. Appended are data on the 48 vessels in service since 1865 and on some 70 individuals whose leadership is honored. Photographs of vessels, harbors, etc., are included. ***Copy seen:*** DLC.

55123. STEEN, JON. Climatic adaptation in some small northern birds. (Ecology, Oct. 1958. v. 39, no. 4, p. 625–29, illus., table.) 18 refs.

A study of O_2-consumption and body temperature in six species of small, northern birds throughout the night and at ambient temperatures of +25° to −25° C. Newly caught birds were unable to maintain their body temperature but when kept at −10° C. for about a week maintained a normal heat balance even during very cold nights.

Copy seen: DLC.

55124. STEEN, JON. Food intake and oxygen consumption in pigeons at low temperatures. (Acta physiologica scandinavica, 1957. v. 39, fasc. 1, p. 22–26, illus.) 8 refs.

Report on experiments with pigeons kept for 2–4 weeks in ambient temperatures of +18°, −10° and −18° C. It was observed that O_2-consumption and food intake in cold below the birds' critical temperature were closely proportional to the body-to-air gradient.

55126. STEENKEN, WILLEM FREDERIK. Geology and petrology of the region south of Russånes, Saltdal, Norway. Amsterdam, 1957. 120 p., illus., diagrs., maps incl. 1 fold. (Amsterdam. Universiteit. Geologisch Instituut. Mededeling no. 244.) Summary in Dutch.

Describes the topography, surface geology, and lithologic characteristics of the bedrock in an inland area (66°50′–66°55′ N. 15°04′–15°24′ E.) of north Norway. Rocks, ranging in age from Archean to Silurian, lacking fossils, were analyzed lithologically to reconstruct the stratigraphic history. Many rock samples are described in detail. Tectonics and metamorphism are summarized for the area, believed to have been a marginal zone of the Caledonian geosyncline; and comparisons are made with features of similar geologic nature elsewhere in Scandinavia and in East Greenland. In reviewing the glacial features it is noted that an erratic boulder on the highest local summit indicates that nunataks did not exist here throughout the glacial period. ***Copy seen:*** DGS.

Text in Danish. ***Title tr.:*** The Northern Sea Route; a study of the Northeast Passage.

Study comprising 26 articles in consecutive issues of this journal, based on the general literature (English, American, French, German, Russian, Scandinavian) and on German Naval documents from World War II; most information and tabulations are adjusted to Jan. 1, 1957; maps in various projections are presented, some specially drawn (by J. Lumbye). A geographical and historical survey with review of expeditions 1553–1931, also of Russian achievements (from 1932) in opening the Route are presented in the first five articles. Subsequently, in turn: questions of sovereignty over arctic land, their background and settlement, are outlined; an ethnographical survey is given; climate, natural conditions, and landscape are described; magnetic conditions, tides, currents, ice conditions, North Siberian rivers and canals, railways and roads, harbors, coastal defences and resources, administration and organization, distances, are dealt with; ice prognosis, ships and icebreakers, ice navigation, air navigation are discussed. Naval events (in particular 1940–44), and developments of the Russian arctic fleet are treated in some detail (Aug.–Oct. 1956: årg. 127, p. 321 *et seq.*). The Arctic's military significance is discussed; development of the arctic submarine is reviewed, and problems of submarine navigation outlined.

55131. STEFANOVICH, ARSENIĬ NIKOLAEVICH. Ledokoly. Moskva, Izd-vo "Morskoĭ transport," 1958. 99 p. illus., diagrs., tables. Text in Russian. ***Title tr.:*** Ice-breakers.

Reviews the development of ice-breakers and ships with reinforced hulls from the primitive type of whale boat to the early ice-breakers, the *Fram* and *Makarov*, to diesel-electric ships, and finally to the atomic ice-breaker. General ice conditions encountered by ice-breakers, ice-breaking methods, effects of drift ice pressure and low temperatures are outlined. Basic construction and reinforcement of the hull, arrangements of decks and quarters, types and operation of main and auxiliary machinery and equipment, and protection of the rudder and propellers are treated in detail. Navigation through ice fields and ships rescue operations are briefly outlined with illus. Specific characteristics are described (with basic data) of recent Soviet and foreign ice-breakers, also transports with reinforced hulls (U.S.S.R., United States, Canada, Sweden, Denmark, Finland and Argentina). Basic tabulated data for 21 ships are appended. ***Copy seen:*** DLC.

55132. STEFANOVICH, ARSENIĬ NIKOLAEVICH. Ot "Ermaka" do atomnogo ledokola. Leningrad, O-vo rasprostraneniîa politicheskikh i nauchnykh znaniĭ RSFSR, 1958. 37 p. illus. Text in Russian. ***Title tr.:*** From the *Ermak* to the atomic ice-breaker.

Outlines development, construction and service of Russian ice-breakers, from the first small ones used by the Russian merchant Britnev in the 1860's. S. O. Makarov's *Ermak* (p. 10–11) and other pre-Revolutionary ice-breakers are sketched; the part played by ice-breakers in the Kara Sea expeditions and development of the Northern Sea Route is described. Principles of ice navigation, ice-breaking by ships, and ice-breaker construction (p. 18–32) are discussed. The recent series of Soviet ice-breakers includes the *Kapitan Belousov*, *Kap. Voronin* and *Kap. Melekhov* built in Finland, and the diesel-electric *Lena*, *Eniseĭ*, *Ob'*, and *Angara* built in Holland. Construction of the atomic-powered *Lenin*, her specifications, equipment, accommodations are described, and her superiority over other types of ice-breaker is stressed (p. 34–37). Other countries' ice-breakers are briefly noted.

Lundequistska Bokhandeln, Uppsala; Einar Munksgaard, København, 1958. 88 p. (Sweden. Landsmåls- och Folkminnesarkivet i Uppsala. Skrifter, Ser. C:2.) Text in Lappish, Swedish and German. ***Title tr.:*** Lappish songs. Texts and melodies from Swedish Lapland. Phonographically recorded by the Archives for Dialect and Folklore Research at Uppsala, I: Jonas Eriksson Steggo's songs.

Contains text and music of songs written by Jonas Eriksson Steggo (1873–1957), a nomadic Lapp from Arjeplog. The songs constitute a continuous autobiographical text. ***Copy seen:*** SPRI.

55142. STEHLI, FRANCIS GREENOUGH, 1924– . Possible Permian climatic zonation and its implications. (American journal of science, Nov. 1957. v. 255, no. 9, p. 607–618, 5 text maps, table.) 10 refs.

"A sharp boundary to the apparent ranges of a number of Permian marine invertebrates [brachiopods and fusulinids] occurs between 50° and 60° N . . . The boundary is believed to be temperature controlled and probably to represent the position of the interface between the Permian subtropical and temperate marine temperature belts. The faunal boundary parallels the earth's present equator and, if truly caused by temperature, precludes the possibility of changes in the position of the poles with respect to the major land masses of the Northern Hemisphere. Also precluded is the possibility that the crust or mantle has shifted its position relative to the core. The data are not in accord with data derived from remanent magnetism of rocks."—*Author's summary.* Maps show major areas with outcropping marine Permian rocks (including Arctic and sub-Arctic) and world distribution of the invertebrates. ***Copy seen:*** DGS.

A discussion of these changes with four case reports of severe (3–4 degree) frostbite. Porosis, osteolysis, sclerosis and atrophy were noted in the frozen extremities, with occasional growth defects, exostoses, etc. ***Copy seen:*** DNLM.

55151. STEPANOV, D. I. Betonirovanie pokrytiia na merzlom grunte. (Transportnoe stroitel'stvo, Apr. 1957. god 7, no. 4, p. 20–21, graphs, diagrs.) 2 refs. Text in Russian. ***Title tr.:*** Concrete covering on frozen ground.

Describes method of laying a special cover of frost-resistant concrete on frozen ground around a water reservoir. At air temperature of −20° C., the frozen ground was covered with a 10 cm. layer of dry sand, a 10 cm. gravel layer and a prefabricated reinforced concrete plate (25 cm. thick). Space between plates was filled with a concrete mass made of portland cement, sand and gravel mixed with 15% NaCl dissolved in water preheated to 40° C. The whole job was covered with a 15 cm. layer of sawdust. The temperatures of air, plate, concrete and ground were recorded during 30 days and the depth of freezing and conductivity of the insulating layer were computed, with equation given. Samples of concrete taken months later were tested and found of satisfactory quality.

Describes a method of systematizing observational data, devised by the author and used in the Arctic Institute's investigations of Soviet seas. In contrast with the descriptive method, used only at the beginning of the study, and the statistical method, which operates with mean values, the new method aims to outline the actual conditions of the basic hydrological factors (ice conditions, water temperature, salinity and color at various depths, water circulation, weather conditions, etc.) typical for each season. Study of the transitions of these seasonal types from one to another must follow with consideration of climatic conditions peculiar to the Arctic where summer and

fall are short (1–1.5 months), spring 4–4.5, and the winter period 5–7 months. Scientific value of results obtained by this method and their application to forecasting are stressed.

55157. STEPANOVA, V. S. Biologicheskie pokazateli techeniĭ v severnoĭ chasti Beringova i ûzhnoĭ chasti Chukotskogo moreĭ. (Leningrad. Gosudarstvennyĭ gidrologicheskiĭ institut. Issledovaniĭa moreĭ SSSR, 1937. vyp. 25, p. 175–216, illus., tables, maps.) 73 refs. Text in Russian. Summary in German. ***Title tr.:*** Biological indicators of currents in the northern Bering and southern Chukchi Seas.

Account of investigation on zooplankton conducted on the trawler *Dal'nevostochnik* in 1932 to a depth of 141 m. with most hauls not exceeding 50 m. in depth. A considerable difference in this fauna was noted as between the eastern and western coasts of both seas. The eastern, American side, showed largely neritic forms of the northern Pacific and Atlantic; the western side had predominantly oceanic forms of Pacific, Atlantic, Arctic, tropic and Antarctic origin. The differences between the two seas were small, the Bering Strait proving no barrier to faunistic exchange. Three new species of the genus *Tintinopsis* and seven varieties are recorded.

gar, May 1954. årg. 74, nr. 5, p. 91–94, map.) 12 refs. Text in Swedish. ***Title tr.:*** An account of the gold in Lapland.

Only sporadic attempts have been made to extract the alluvial gold first discovered in 1546. Gold-washing started in 1870; an estimated 1,000–1,500 kg. has been washed. Existence of gold ore is indicated (at Kultala and Ruikka); no thorough search has been undertaken; several discoveries are cited.

Copy seen: DLC.

55168. STIGZELIUS, HERMAN. The growing importance of Finnish iron ore mining. (Bank of Finland. Monthly bulletin, May 1958. v. 32, no. 5, p. 18-20, map.)

Iron ore is in production at Otanmäki, central Finland, and several other deposits have been discovered, among them Kärväsvaara, a small deposit in the Kemijärvi district, and Kolari (67°22′ N. 23°50′E.) in west Lapland. At Kolari both hematite and magnetite ores are found with 30–40% iron content and properties favorable for concentration purposes. Iron concentrate production may begin about 1963 at 500,000 tons/yr. Finland's output of iron in concentrated and crude ore (excluding pyrite residues), now about 200,000 tons/yr., may exceed a million tons by the mid-1960's.

Copy seen: SPRI.

55169. STIGZELIUS, HERMAN. Mining in Finland in 1957. (Canadian mining journal, May 1958. v. 79, no. 5, p. 93–94, table, text map.)

Reviews metal mining activities: total amount of ore and waste rock extracted was 2,400,000 metric tons (2,100,000 in 1956). Principal mines and smelters, discovery of new iron ore deposits in the Kolari region (approx. 67°20′ N. 23°45′ E., near Swedish border), increased extraction achieved at two mines and impending close-down at three others are noted. Preliminary construction is underway at three sites, one nickel-copper, and two iron deposits. Production of metals or concentrates for 1956 and 1957 is shown (table), copper, iron and zinc having greatest amounts. ***Copy seen:*** DGS.

55170. STILLE, HANS, 1876– . Geotektonische Gliederung der Erdgeschichte. Berlin, 1944. 80 p. diagrs. (Akademie der Wissenschaften, Berlin. Abhandlungen, Mathematisch-naturwissenschaftliche Klasse, 1944, nr. 3.) 60 refs. Text in German. ***Title tr.:*** The geotectonic division of earth history.

The early geologic history of the earth is broadly reviewed. Emphasis is on the Precambrian shields and geosynclinal areas which make up present continental masses. Of arctic interest are the descriptions of Laurentian, Baltic, Fennosarmatian, and Angaran shield locations. In their neighboring geosynclinal seas, sediments accumulated from which the Rockies, Caledonides and other mountains were built. Interpretations by leading geologists of the three shield regions are discussed. ***Copy seen:*** DGS.

55171. STILLE, HANS, 1876– . Geotektonische Probleme des pazifischen Erdraumes. Berlin, 1944. 77 p. illus., diagrs. (Akademie der Wissenschaften, Berlin. Abhandlungen. Mathematisch-naturwissenschaftliche Klasse, 1944, nr. 11.) 17 refs. Text in German. ***Title tr.:*** Geotectonic problems of the Pacific area.

Interpretation of the tectonic history of the Pacific portion of the earth are summarized. In the Arctic, the Precambrian Laurentian shield is believed to have extended to the islands north of Siberia and to have been separated from the Angaran shield by a narrow zone of mobility. The geosynclinal seas from which the east Siberian and northern Rocky folded and faulted mountains were developed are said to have coaleseed near Kamchatka. The volcanic island chains of the north Pacific are briefly mentioned.

55189. STRAND, TRYGVE. Greenschists from the south-eastern part of Helgeland, Norway, their chemical composition, mineral facies and geologic setting. (Norway. Geologiske undersøkelse, Årbok 1957, *pub.* 1958. nr. 203, p. 112–29, tables.) 24 refs. Summary in Norwegian.

From Helgeland, in the southern part of northern Norway, the greenschists described extend eastward into Sweden and northward into the Dunderdalen region of Norway, where they lie below a thrust plane overlain by high grade metamorphic rocks. The greenschists are low grade metamorphics of probable Ordovician age. Analyses of four samples are tabulated and compared to associated rocks. Their mineralogy, chemistry, and refraction indices are discussed. Their facies interpretation is questionable, depending on use of albite-epidote or ferro-magnesian content as basis for determination. It is concluded that they were probably supracrustal, submarine deposits in a geosyncline bordered on both sides by continental areas. Their occurrence is contrasted with present deposition in the Indonesian area and with that of similar, former deposition in the British Columbia-Aleutian island geosynclinal arc.

55194. STRELKOV, S. A. Led-gidrotekhnik. (Vokrug sveta, Sept. 1958, no. 9, p. 31, illus.) Text in Russian. ***Title tr.:*** Ice: hydroengineer.

Photograph of the tundra in the Lena River delta, with its numerous small ponds or lakes, and note explaining this feature by deep wedges of ice formed in winter in the fissures of the ground.

Copy seen: DLC.

55195. STRELKOV, S. A. Novye dannye o rel'efe i chetvertichnykh otlozheniĭ͡akh doliny r. Leny k severu ot Severnogo polĭ͡arnogo kruga. (*In:* Leningrad. Nauchno-issledovatel'skiĭ institut geologii Arktiki. Trudy, 1956. t. 89, Sbornik stateĭ po geologii Arktiki, vyp. 6, p. 308–317.) 5 refs. Text in Russian. ***Title tr.:*** New data on the relief and Quaternary deposits of the Lena River valley above the Arctic Circle.

Presents results of a field investigation and examination of air photos and topographic maps of the Lena valley from Zhigansk to the delta. Geomorphic structure of the Lena terrace complex is outlined. The lower, middle, upper and contemporary sections of Quaternary deposits are described.

Copy seen: DLC.

55196. STRELKOV, S. A., *and others.* O vozmozhnoĭ tektonicheskoĭ prichine pereustroĭstva rechnoĭ seti v nizov'ĭ͡akh rek Leny i Olenek. (Leningrad. Nauchno-issledovatel'skiĭ institut geologii Arktiki. Informat͡sionnyĭ bi͡ulleten', 1957, vyp. 6, p. 15–19.) 2 refs. Text in Russian. *Other authors:* A. P. Puminov, *and* A. N. Naumov. ***Title tr.:*** On possible tectonic cause in the reconstruction of river net of the lower courses of Lena and Olenek Rivers.

Presents observations made in the Lena valley below the town of Sintyakh, in the Olenek valley and other old valleys of the region. In reviewing their development and character, authors confirm that the Lena once flowed through the Kelimyar and Olenek valleys into Olenekskiy Bay. At that time the Olenek possibly flowed into the Lena through the Kyutingsk valley. The reconstruction of the Lena and Olenek valleys, believed to have taken place in post-Quaternary period, is evaluated, and tectonic and erosional processes in this development are discussed. ***Copy seen:*** DGS.

55204. STRONG, A. M. Notes on the Mactras of the West Coast. (Nautilus, Jan. 1925. v. 38, no. 3, p. 98–102.)

Lists 11 species of the *Mactra* group, with taxonomic notes. The surf clam, *Spisula* (*Hemimactra*) *voyi,* ranging from the Arctic Ocean to Puget Sound and *Schizothaerus nuttallii,* from Wrangell, are included; the former is also repre-

sented by a living form in Dall's *S. polynyma* Stimpson var. *alaskana*.

Copy seen: DSI.

55205. STRONG, E. M., *and others.* Microwave radio communication under severe winter conditions on the Bonneville Power Administration System. (American Institute of Electrical Engineers. Transactions, 1957, pt. 1, Communications and electronics, p. 655–62, illus., map, diagrs., table.) 3 refs. *Other authors:* E. J. Warchol *and* S. E. Benson.

Describes methods of protecting antennas, reflectors, and towers against snow- and ice accumulation in Washington State mountain links. Ice on the parabola (up to 12 in.) caused blocking of the signals and alteration of the beam angle, falling ice from parallel power lines damaged reflectors, and snow (over 25 ft.) broke towers and steel guys. Electric de-icers proved unsatisfactory. Dark enclosures (thermo-microdomes) of three-ply fiber-glass fabric laminated with polyester resinate and thermostatically controlled heating were applied with success over the parabolic antennas. Pneumatic vibrators with low amplitude and high frequency, automatically employed 15 sec./8 hrs. remove ice formations formed by frozen cloud crystals in the wind direction and reaching out to 20 ft. Tower construction for severe winter conditions is discussed, guyed towers are not favored where snowfall exceeds 20 ft.; 10-in. pipe supports are to be tried in 1957. ***Copy seen:*** DLC.

55216. SUGIURA, MASAHISA. Some notes on the interpretation of rapid fluctuations in earth-currents observed in high latitudes. College, Dec. 1958. 27 p. table, diagr. (Alaska. University. Geophysical Institute. Geophysical research report no. 5.) 17 refs.

A periodically varying infinite linear current, or a periodically varying turbulent circular current of small radius, in the ionosphere, is adequate for producing voltage differences in the ground of order 0.1–1 v./km. frequently observed in high latitudes during disturbed periods. The earth-current record is difficult to interpret in terms of its primary origin, unless the distribution of the perturbing magnetic field and that of electric conductivity of the earth are known; but the record is a good indicator of the upper atmospheric disturbance in the polar regions.—From author's abstract.

55232. SUNDT, EIVIND. Revision of the Fenno-Scandian species of the genus *Acrotrichis* Motch., 1848. Contribution to the knowledge of the family Ptiliidae (Col.) IV. (Norsk entomologisk tidsskrift 1958. bd. 10, hefte 4–5, p. 241–77, 6 illus., 4 plates.) 18 refs.

Contains a key and description of 23 species, with differential diagnoses, morphological notes and data on distribution. Four species are new to science, including *A. strandi* n. sp., native to Troms and Finnmark; at least four others are recorded "throughout the whole of Fenno-Scandia." ***Copy seen:*** DLC.

55233. SUNIK, OREST PETROVICH. K tipologicheskoĭ kharakteristike ɯzykov tunguso-man'chzhurskoĭ gruppy. (Voprosy ɯzykoznaniĭa, Nov.–Dec. 1957. god 6, p. 3–14.) 14 refs. Text in Russian. ***Title tr.:*** Typological characteristics of the Tungus-Manchu language group.

Discusses the morphology, word formation, modification and repetition, stress, intonation and use of suffixes in the agglutinative languages of the Tungus group: Eveny (Lamuts), Evenki, Golds, etc. ***Copy seen:*** DLC.

55234. SUNIK, OREST PETROVICH. O ɯzyke zarubezhnykh nanaĭtsev. (Akademiĭa nauk SSSR. Institut ɯzykoznaniĭa. Doklady i soobshcheniĭa, 1958. no. 11, p. 168–84, tables.) 16 refs. Text in Russian. ***Title tr.:*** The language of the Golds living abroad.

Discusses the phonetic and morphologic peculiarities in the dialect spoken by Golds living in northeastern China, along the right bank of the Amur River. Only small linguistic differences are observed. ***Copy seen:*** DLC.

55235. SUNIK, OREST PETROVICH O morfologicheskom sostave slova v agglɥtinativnykh ɯzykakh. (Akademiĭa nauk SSSR. Izvestiĭa, Otdelenie literatury i ɯzyka, July–Aug. 1958. t. 17, vyp. 4, p. 331–42.) 21 refs. Text in Russian. ***Title tr.:*** The morphological composition of the word in agglutinative languages.

Discusses word structure, morphemes, suffixes, inflections, etc., mainly of the Tungus language group and challenges the opinion, prevalent among Soviet linguists, that words in agglutinative

languages cannot be divided into roots and endings. ***Copy seen:*** DLC.

55236. SUNIK, OREST PETROVICH. Soveshchanie po iazykam narodov Severa. (Voprosy iazykoznaniia, Mar.–Apr. 1953, no. 2, p. 132–42.) Ref. Text in Russian. ***Title tr.:*** Conference on the languages of the peoples of the North.

Summarizes nine papers on the development, teaching and orthography of the literary dialects of Ural-Altaic and Paleosiberian languages. They were read (as listed below, with titles translated) at plenary sessions of the Institute of Linguistics (Institut iazykoznaniia) of the Academy of Sciences, U.S.S.R., and other educational institutions' conference Dec. 8–13, 1952, at Leningrad (cf. No. 27677), and published as *Soveshchanie po iazykam narodov Severa. Tezisy dokladov,* Moskva-Leningrad, 1952 (copy not seen). Four of the papers (*) were combined and enlarged later by Avrorin, q.v.

Barkhudov, S. G. Present state and problems of the scientific and practical work done in the field of languages of the peoples of the North. *Criticizes* the approach to linguistics based on erroneous theories of N. IA. Marr and discusses development of new, literary languages of the North in relation to spoken dialects.

Tereshchenko, N. M. Russian as an influence for progress in languages of the peoples of the North. *Supports* use of Russian loanwords for terms without vernacular equivalent, but opposes indiscriminate russification of the newly developed literary languages.

Boltsova, A. F. Problems in study of the mother tongue and Russian in schools of the peoples of the North. *Discusses* difficulties confronting native children in the third grade, where Russian supersedes the vernacular as the language of instruction.

*Avronin, V. A. Literary languages of the peoples of the North and local dialects.

*Konstantinova, O. A. The dialect foundation of the Evenki (Tungus) language.

*Novikova, K. A. The dialect foundation of the Eveny (Lamut) literary language.

*Tereshkin, N. I. Present problems in the development of the Voguls' literary language.

Skorik, P. IA. Problems of orthography in the languages of the peoples of the North. *Advocates* introduction of new phonetic signs to express sounds not represented in the Cyrillic alphabet; suggests adapting the orthography of Russian loanwords to the phonetic and morphological laws of the vernacular.

Almazova, A. V. The present state and future plans for publication of text books for the schools of the peoples of the North. *Criticizes* the paucity of Russian and vernacular primers, readers and textbooks due to deficient translators and writers, lack of dictionaries and grammars, poor development of the literary vernacular, etc.; existing textbooks should be completely revised and new ones published.

Appended (p. 139–42) is a synopsis of Conference discussion of these papers, excerpts from its resolutions on the development of new written languages, choice of dialects for developing the literary ones, enlargement of the school net and enforcement of general education, etc. ***Copy seen:*** DLC.

Discussion of speed-up in lowering and hoisting the trawl and in cutting up, gutting and rinsing the fish. The condition of working tools, the problem of standing during work, etc. are also considered. ***Copy seen:*** DLC.

55238. SUSHKINA, NADEZHDA NIKOLAEVNA. Dva leta v Arktike. Moskva, Izd-vo Akademii nauk SSSR, 1957. 176 p. illus., ports. 2 fold. maps. (Akademiia nauk SSSR. Nauchno-populiarnaia seriia.) 45 refs. Text in Russian. ***Title tr.:*** Two summers in the Arctic.

Accounts of a trip to Novaya Zemlya in 1954 (p. 5–108) and to Franz Joseph Land in 1955 (p. 109–172). On June 25, 1954, the author left Moscow and flew via Arkhangel'sk, Nar'yan-Mar and Amderma to Belush'ye (71°32′ N. 52°18′ E.) the administrative center of Novaya

Zemlya at Belush'ya Bay. Thence she traveled by ship (latterly the *Rzhev*) up the west coast, visited Malyye Karmakuly, Gribovaya Bay, Cape Stolbovoy at the entrance to the Matochkin Shar Strait, the settlement of Lagernoye (73°20′ N. 54°21′ E.), Mityushikha, Krestovaya, Mashigina, Glazova and Vil'kitskogo Bays, and Russkaya Gavan'. She rounded the north end of the island, crossed the Kara Sea and after visiting the settlement of Kharasovoy (71°06′ N. 66°45′ E.) on Yamal Peninsula, reached Dikson Island in the middle of August, took the steamship *Kooperatsiia* to return to Arkhangel'sk.

In summer 1955, the author made a trip as a passenger on the "ice-breaker type" cargo steamship *Dezhnev* which sailed across the White and Barents Seas to Franz Joseph Land, entered Cambridge Strait with the aid of the new Soviet ice-breaker *Kapitan Belousov*, unloaded some cargo at Nagurskaya Station (80°46′ N. 46°39′ E.) on Alexandra Land, sailed along the coast of (Prince) George Land and Bell, Mabel and Bruce Islands, passed British Channel, Markham and Pondorff Straits, unloaded the rest of the cargo on Kheysa (Hayes) Island and on Aug. 4, headed back. The visited places on each trip are briefly described with information on inhabitants and their occupations, fauna, and flora, etc. Exploration is reviewed for Novaya Zemlya (p. 7–24) and Franz Joseph Land (p. 130–34); geological history is outlined (p. 99–107, 135–38). Glaciers and their types in both areas are noticed in scattered remarks. Numerous photographs of visited places are reproduced, and a cross section of the steamship *Dezhnev* is given (p. 117).

Doklady, Mar. 21, 1957. t. 113, no. 3, p. 667–70, text map, fold. table.) 10 refs. Text in Russian. ***Title tr.:*** The Lena stage of the lower Cambrian of the northern part of the Siberian platform.

The Lena stage is divided by earlier investigators into three principal provinces: Sinsko-Botoma, Olekma, and Yudomo-Olenek. The author explored chiefly the last, northern, subdivision, which consists of bituminous shales with two complexes of fossil fauna. In lower deposits are *Lermontovia dzevanovskii* and species of *Pagetina* and *Botsfordia;* the upper deposits include *Lermontovia grandis, L. convexa, Paramicmacca siberica, P. petropavlovskii, Micmacca tumida,* etc. Study of this fauna leads to the conclusion that the lower Cambrian deposits of bituminous shales of the Olenek geological provinces are closely related to bituminous shales of Lena stage of the Sinsko-Botoma subdivision; difference in thickness of the deposits is explained by different conditions of accumulation of such deposits during the Lena era. A comparative scheme of Lena stage deposits and faunas is presented (fold. table).

Account of experiments with dogs made hypothermic to 26.3°–32.0° C. by cold immersion. In the chilled group secretion of the hydroxycorticosteroids invariably increased 1.7 to 2.9 fold over the controls. ***Copy seen:*** DNLM.

55250. SVATKOV, N. M. Pochvy ostrova Vrangelîa. (Pochvovedenie, Jan. 1958, no. 1, p. 91–98.) 5 refs. Text in Russian. Summary in English. ***Title tr.:*** The soils of Vrangel Island.

Outline based chiefly on unpublished materials from investigations by Z. I. Îashina. Vrangel Island belongs to the aretic desert area; its vegetation is scanty and sporadic, the terrain partly rocky. The polygonal ground, turf, gley, bog and mountain soils of the island are distinguished and described in turn. The island's soil has many features which derive from the extremely severe conditions of vegetation, the dominant influence of physical over biological processes during soil formation. The soil cover is spotty because of the polygonal microrelief. Its specific features are: disrupted profile, absence of signs of gleying processes, sharp variations of the thickness of soil horizons and interrupted character of their distribution, neutral reaction, etc. The structure of soil horizons changes constantly under influence of freezing and solifluction processes.—From author's summary.

55261. SVENSSON, HARALD. Fluviatil-glacial dalutveckling. Några synpunkter på uppkomsten av hängande bidalar med exempel från Svalbard. (Svensk geografisk årsbok 1958. årg. 34, p. 176–81, illus., map.) Text in Swedish. ***Title tr.:*** Fluvio-glacial development of valleys; some viewpoints on the origin of hanging subsidiary valleys with examples from Svalbard.

Based on a study of maps and air photographs of Vestspitsbergen. Fluvial erosion in the glacially formed valleys is described. Several factors creating hanging subsidiary valleys are mentioned: active landslide processes developing more quickly in the upper parts of the erosion ravines; the local erosion base being successively raised as erosion material accumulates in the lower parts of the ravines; a natural hanging phenomenon developing from petrographic causes. The development of comparatively small ravines into ice and snow filled cirques is illustrated. A cirque originating from a ravine has a primary difference in level from the bottom of the main valley. The hanging which characterizes the cirque need thus not be exclusively a function of glacial processes in the main valley. ***Copy seen:*** SPRI.

vårdsföreningen. Tidskrift, 1956. årg. 54, nr. 2, p. 205–208, graphs, table.) 3 refs. Text in Swedish. ***Title tr.:*** A cartometric method for determination of tree-line elevation.

Describes a laboratory method which has been used to calculate the upper limit of mountain birch on the Swedish-Norwegian border mountains. At 65° N. lat., a tract 130 km. (east-west) by 20 km. was divided into thirteen 10 x 20 km. rectangles. For each rectangle, a hypsographic curve was drawn from analysis of contour lines on topographic maps, and the area above the tree line, determined by planimetric measurement of the unforested area, was marked on the abscissal axis; the tree line elevation is given by the ordinate from this mark on the abscissa to the curve. On the 13 rectangles so studied, the tree line was found to range from 417 m. near the west coast of Norway to 810 m. at a distance of 110 km. farther east. Reasons for the range are briefly suggested. ***Copy seen:*** DA.

Text book for use in fisheries schools, with an introduction to oceanography in general, and description of water masses and currents affecting fisheries off the Norwegian coast. ***Copy seen:*** DLC.

55267. SVERDRUP, HARALD ULRIK, 1888–1957. The stress of the wind on the ice of the Polar Sea. Oslo, Fabritius & Sønners forlag, 1957. 11 p., tables, diagrs. (Norway, Norsk Polarinstitutt. Skrifter, nr. 111.) ref.

Contains results of investigations by pilot balloon ascents in the area 71°59′–76°43′ N. 170°50′ W.–138°06′ E. in 1922–24 while the *Maud* was drifting in ice north of northeastern Siberia. In only 20 of 375 cases was the wind found to be practically constant through several hundred meters over the layer of frictional resistance. In the assumption that this wind represented the geostrophic wind, the surface stress was computed from the results of these 20 observations (mathematical formulae given). The direction of the stress did not coincide with the wind direction, as expected, but was on average directed 10° to the left of the wind. This discrepancy is considered of little significance because of the uncertainty of the data: the results are not conclusive. ***Copy seen:*** DLC.

55268. SVERDRUP, HARALD ULRIK, 1888–1957. Tätigkeit des Norwegischen Polarinstituts. (Petermanns geographische Mitteilungen, 1957. Jahrg. 101, Heft 2, p. 114.) Text in German. ***Title tr.:*** The activity of the Norsk Polarinstitutt.

Current geological, oceanographic investigations and mapping of Svalbard, permanent observations of the glacier Finsterwalderbreen (Vestspitsbergen) and biennial expeditions to Svalbard are noted. IGY work and activities in the Antarctic are mentioned. Efforts are noted to establish new radio stations on Kap Linné

and Bjørnøya and to have the University of Bergen start seismic measurements in the Arctic. ***Copy seen:*** DLC.

Description of nine forms new for the area, collected in 1955 and 1956 in the Kandalaksha Bay. Both benthonic and pelagic worms are included. Earlier records and data on distribution are supplied. ***Copy seen:*** DLC.

55271. SVETOVIDOV, ANATOLIĬ NIKOLAEVICH, 1903– . The Atlantic origin of some groups of fishes. (*In:* International Congress of Zoology, 14th, Copenhagen, 1953. Proceedings, 1956, p. 118–24.) 40 refs.

Comparison of the northern parts of the Pacific discloses great similarity with the fauna of northern parts of the Atlantic, but the former is richer in species, genera and even families. The Pacific Gadidae show characteristics of North Atlantic or even Arctic origin, evident in their recent distribution, ecology, location of fossil remains and their age. The distribution of the Clupeidae differs essentially from that of the Gadidae: commoner in warmer waters and fewer in number (about 20 species) they are distributed in boreal subregions. In comparing the number of clupeoid species occurring in the North Atlantic and Pacific however, a predominance of the Atlantic forms over the Pacific is observed, as in the Gadidae. Both families could have migrated into the Pacific during the Pliocene and in the Bering Strait region during the marine postglacial transgression, when the climate was warmer than the present one.

55272. SVÎATLOVSKIĬ, ALEKSANDR EVGEN'EVICH. Istoriîa novelshego vulkanizma i obrazovaniîa rel'efa v raĭone vulkana Bakenin. (Akademiîa nauk SSSR. Laboratoriîa vulkanologii, Trudy, 1956. vyp. 12, O vulkanizme, geologii i gidrotermakh Kamchatki, p. 53–109, illus., maps.) 28 refs. Text in Russian. ***Title tr.:*** History of the recent volcanism and of formation of relief of the Bakenin Volcano area.

The extinct Bakenin Volcano (called also Mt. Bakening, 2273 m. above the sea level, 53°55′ N. 158°10′ E.) is located on the watershed of the upper reaches of the three main rivers, Kamchatka, Avacha and Bystraya, of Kamchatka Peninsula. The geographic position, geomorphology, stratigraphy, petrography and tectonics of the volcano and of its parts are described and their connection with the geomorphology of adjacent regions is discussed. Five stages of relief formation are postulated; that preexistent to formation of the most ancient andesite-pyroclastic stratum; relief after the eruptions which formed this stratum; relief of caldera during basaltic effusions; relief influenced by ancient glaciation; present-day relief; the formation changes and interaction of these stages are discussed (p. 99–106). ***Copy seen:*** DLC.

55273. SVÎATLOVSKIĬ, ALEKSANDR EVGEN'EVICH. IÛzhno-Bystrinskiĭ khrebet na Kamchatke. (Akademiîa nauk SSSR. Laboratoriîa vulkanologii, Trudy, 1956. vyp. 12, O vulkanizme, geologii i gidrotermakh Kamchatki, p. 110–90, illus., tables, maps.) 29 refs. Text in Russian. ***Title tr.:*** The

Yuzhno-Bystrinskiy Range on Kamchatka.

Monographic study of the structure of the region roughly 52°20′–53°20′ N. and from 157° E. eastward to the coast in southeast Kamchatka, based chiefly on the author's investigations in 1947–48 and 1952–53. The region comprises Yuzhno-Bystrinskiy Range proper, the southeast end of Vostochnyy Khrebet, approx. 52°45′ N. 158° E., and adjoining areas of the Avachinskiy-Koryakskiy volcanoes group in the north, the lava plateau in the west, and Mutnovskiy and Gorelyy volcanoes in the south. The orography, geology, recent volcanic activity, petrography, tectonics, geomorphology, and glacial deposits are treated in turn. For the Yuzhno-Bystrinskiy Range and some of its environs, the Avacha and other river valleys, Nachiki Lake depression, etc., the geological history is outlined in relation to volcanism.

55275. SVÎATLOVSKIĬ, ALEKSANDR EVGEN'EVICH. O gidrogeologicheskom raĭonirovanii termal'nykh podzemnykh vod Kamchatki. (Akademiîa nauk SSSR. Doklady, Mar.–Apr. 1957. god 25, t. 113, no. 1, p. 175–78, diagr. map.) 3 refs. Text in Russian. ***Title tr.:*** Hydrogeological zoning of the thermal ground water of Kamchatka.

Formation of large artesian basins of hot water on platforms between mountains is discussed for the Kamchatka region by analogy with Caucasian and Ferganian synclines. The similar geological formation of Kamchatka Peninsula suggests the possibility of hot-water accumulation at 1,500–2,000 m. depth. Systematic changes in formation of the artesian basin of hot and superheated water in the volcanic region is illustrated. The largest such basins are considered in four of the tectonic subdivisions of Kamchatka in turn: the central depression, western lowland, eastern volcanic zone (Pacific coast), and southern volcanic zone. Deep drilling is expected to disclose information on the hydro-geology and the possibility of oil and gas concentrations. ***Copy seen:*** DLC.

55276. SVÎATLOVSKIĬ, ALEKSANDR EVGEN'EVICH. Probuzhdenie Bezymîannogo. (Vokrug sveta, May 1958, no. 5, p. 40–41, illus., map.) Text in Russian. ***Title tr.:*** The awakening of Bezymyannyy Volcano.

Brief account of the great eruption of this dormant volcano. Its first stage, preceded by seismic tremors, began on Oct. 22, 1955, with the ejection of gas, small stones and ashes; at the end of March 1956, a pillar of burning vapors appeared and the explosion was followed by a mushroom of large dark cloud. A group of the Soviet volcanologists, headed by the chief of the Kamchatka Volcanological Station at Klyuchi, made a trip to the volcano. The former cone was almost totally destroyed; a new crater, 1.5–2 km. wide, was formed. The volcano's activity subsided only late in the fall of 1956. This eruption is regarded as one of the biggest in Kamchatka and similar to the Katmai eruption in Alaska in 1912.

55279. SVORAD, D. The influence of lowering the body temperature on postural orientation of the organism. (Experientia, June 1957. v. 13, no. 6, p. 245, table.) Summary in German.

Summary of experiments with rabbits (30) submitted to progressive hypothermia of 25° to 14° C. core temperature. Lowering of body temperature first caused extinction of Magnus' body righting reflexes with the labyrinthine postural reflexes disappearing last. Recovery upon rewarming takes place in a reversed order. ***Copy seen:*** DLC.

55280. SWADESH, MORRIS, 1909– . Lexico-statistic dating of prehistoric ethnic contacts; with special reference to North American Indians and Eskimos. (American Philosophical Society. Proceedings, Aug. 1952. v. 96, no. 4, p. 452–63.) 12 refs.

Discusses the methods and application of glottochronology to establish the time of separation of languages derived from a common ancestral stock, including the Eskaleut and Nadene groups. The concurrence between time depth calculations, establishing the existence of a common Eskimo-Aleut language about 2,900 years ago, and the radiocarbon dating of the earliest settlements on the Aleutian Islands (approx. 3,000 years old) is stressed. An Eskaleut relationship with Ural-Altaic and Indoeuropean, and Nadene ties with Sinotibetan are considered probable. ***Copy seen:*** DLC.

55286. SWEET, WALTER C., *and* **A. K. MILLER.** Ordovician cephalopods from Cornwallis and Little Cornwallis Islands, District of Franklin, Northwest Territories. Ottawa. Queen's Printer, 1957. 86 p. 8 plates, 2 maps (1 fold.), tables, diagrs. (Canada. Geological Survey. Bulletin 38.) 62 refs.

Detailed study of cephalopods gathered by R. Thorsteinsson in summers 1950–1953, from three formations on west and southwest Cornwallis and on eastern Little Cornwallis Island. The cephalopod faunas, their occurrence, significance as part of the so-called "Arctic" fauna, and color markings are discussed. A thick, folded and conformable sequence of marine formations of miogeosynclinal origin that ranges in age from Middle Ordovician to Late Silurian or Early Devonian comprises the greatest thickness of exposed bedrock. Small isolated patches of two younger formations rest unconformably on these older rocks. Paleontological evidence is carefully evaluated, and correlations are discussed in some detail. The geomorphology and other physical aspects of the islands are described by Thorsteinsson. A generalized geologic map (1:506,880) shows distribution of formations, fossil locations, etc. ***Copy seen:*** DGS.

55287. SWENSON, GEORGE W., *Jr.* VHF diffraction by mountains of the Alaska Range. (Institute of Radio Engineers. Proceedings. Aug. 1956. v. 44, no. 8, p. 1049–50.) *Also pub. as:* Alaska. University. Geophysical Institute. Contributions, ser. B, no. 14.

Usable television signals were received at Lake Minchumina, Alaska, over a distance of 200 mi. from the transmitters in Anchorage though Mt. McKinley was almost in the line-of-sight path. In order to study variations in the signal strength, ground station and airborne measurements of the 200 mc signal were made during the summer of 1955. Time- and space-variations in the signal strengths can probably be explained by meteorological conditions along the scattering path and/or diffraction by widely-separated mountain peaks. The results appear to substantially support the knife-edge diffraction theory.

Reports results of a 1956–57 investigation of a cross-section of Lower, Middle and Upper Jurassic and Lower Cretaceous deposits in the Zhigansk (66°45′ N. 123°20′ E.) region. The strata of these deposits, their stratigraphic division and floral and faunal characteristics are described. ***Copy seen:*** DGS.

55292. SYKES, J. H. M. The Russian nuclear-powered ice-breaker *Lenin.* (Discovery, Dec. 1958. v. 19, no. 12, p. 498–503, illus., diagrs.)

Describes this 16,000-ton vessel, mostly from a paper presented to the Second United Nations International Conference on the Peaceful Uses of Atomic Energy, and other papers given at Geneva, 1955 and 1958, by A. P. Aleksandrov, and others. Some 700 ft. long and over 80 ft. wide, the *Lenin*, launched in Dec. 1957, generates 44,000 hp., attains full speed at 18 knots, and is able to stay at sea without refueling for at least 12 months. General plans of the reactor and steam generator are shown; problems of design, choice of reactor, safety devices, method of operation, and advantages of nuclear propulsion are discussed. The *Lenin* is equipped with three screws, designed to give maximum thrust equal to 330 tons when driving into ice; installed power capacity in terms of hp./t. is 2.75. The highly resistant steel hull, special heeling and trimming systems for navigating through ice floes, and other special features are noted. ***Copy seen:*** DGS.

55306. TÅNING, Å. VEDEL, 1890–1958. Experiments on the meristic and other characters in fishes, 1; on the influence of temperature on some meristic characters in sea-trout and the fixation period of these characters. København, 1944. 66 p., illus., tables, map. (Denmark. Kommissionen for Danmarks fiskeri- og havundersøgelser. Meddelelser, bd. 11, no. 3.) 67 refs.

Account of experiments in rearing these fish at various temperatures. The highest number of vertebrae was produced by the lowest and highest temperatures; intermediate temperatures produced the lowest number. The embryo was not susceptible to such changes when more than 150 D°old. Rays of different fins were not equally affected by temperature nor was their fixation time the same. The bearing of the present findings on the problem of "races" of commercial fish is analyzed and discussed.

Annales biologiques, 1955, *pub.* 1957. v. 12, p. 165–67, maps.) *Other authors:* H. Einarsson *and* J. Eggvin.

The records cover the area between Norway, Iceland and Svalbard, for June 1954 and 1955. Temperature distribution, and location of shoals are charted. The character of the shoals (scattered, dense, etc.) is also indicated and the development of the whole research project traced. ***Copy seen:*** DI.

55310. TABATA, TADASHI. On the formation and growth of sea ice especially on the Okhotsk Sea. (*In:* Arctic Sea Ice Conference. Proceedings, 1958. p. 169–80, 2 text maps, 13 graphs, diagr., 4 tables.) 14 refs. Contribution no. 389 from Institute of Low Temperature Science, Sapporo, Japan.

"Investigations conducted and forecast techniques developed are summarized. Ice thickness and the date of the beginning of ice formation in the central and northern parts of the sea are determined theoretically, assuming that ice formation begins when the temperature in the convection layer of the sea is cooled to the f.p. The relation between air temperature and maximum ice thickness is obtained using Fourier's heat-transfer equation, and the distribution of maximum ice thickness is then calculated. The coefficient of ice accretion is determined theoretically taking into account ice formation not only at the boundary surface but in the middle layer. Data are graphed on the critical depth of ice formation, cooling curve, calculated date of ice formation and ice thickness in the Okhotsk Sea, and the dependence of ice accretion on air temperature and the salinity of water and ice."—SIPRE. ***Copy seen:*** DN-HO.

55311. TABATA, TADASHI. Studies on the visco-elastic properties of sea ice. (Teion kagaku, 1956. ser. A, no. 15, p. 101–115, illus. tables.) 8 refs. Text in Japanese. Summary in English.

A rectangular ice bar was subjected to static load of 16.8 kg., and a cylinder of ice to compressive stresses of 2.7–3.8 kg./sq. cm., for periods of two–nine hrs., and their viscous and elastic constants determined from strain-time curves. Both the elastic and viscous constants were larger when stress was applied normal to the ice surface than when applied parallel to it. The constants were also larger in bending than in compressive tests, probably due to differences in temperature and salinity of the ice and the type of stress. ***Copy seen:*** DWB.

55312. TABATA, TADASHI. Studies on visco-elastic properties of sea ice. (*In:* Arctic Sea Ice Conference. Proceedings, 1958. p. 139–47, illus., 3 tables, 3 diagrs., 6 graphs.) 18 refs. Contribution no. 390, Institute of Low Temperature Science, Sapporo, Japan.

The visco-elastic properties of sea ice were determined from strain-time curves obtained from compression of a floating rectangle of ice severed on three sides from the ice cover and loaded at the free end or center. The viscosity was higher when stress was applied parallel to the ice surface than when applied normal to it. The elastic constant exhibited a tendency to increase with decreasing temperature.—From SIPRE. ***Copy seen:*** DN–HO.

55313. TABER, RICHARD D. Eskimo hunters: whales; the bird shooters; big game on the Chukchi. (Pacific discovery, May–Oct. 1958. v. 11, no. 3, p. 18–21, no. 4, p. 7–10, no. 5, p. 10–13, illus.).

Presents a series about hunters at Wainwright, Alaska (70°39′ N. 159° 50′ W.) on the Chukchi Sea coast, 200 mi. southwest of Point Barrow. Hunting of whales, eider ducks, ptarmigan, black brants, seals, walrus, caribou, foxes and polar bears is described. The author's main interest was in finding the extent and importance of hunting in the culture and economy of the Alaskan Eskimo in 1956. He found it still a strong factor in both: for prestige as well as sustenance. ***Copy seen:*** DLC.

55314. TABER, STEPHEN, 1882– . Complex origin of silts in the vicinity of Fairbanks, Alaska. (Geological Society of America. Bulletin, Jan. 1958. v. 69, no. 1, p. 131–36, map, table.) 6 refs.

Elaborates on theory of complex origin of silts (cf. No. 32357). The relative importance of glaciation and frost action in their origin is considered, and whether they were deposited in their present location chiefly by water or by wind. Samples are described: mineral and

chemical composition, texture, structure, etc. Age of the older silts is pre-Wisconsin, possibly early Pleistocene. A tentative origin during the Yarmouth interglacial stage is indicated for the younger ones. These Alaskan silts are compared with Mississippi Valley loess. It is concluded that most of the silt has been formed from Birch Creek schist by frost disintegration; and the thick valley silts, forming the bulk of the deposits, have reached their present location by water. ***Copy seen:*** DGS.

Description of morphological, physiological and culture properties of a new

species of Grampositive bacteria, viz. *Bacillus dendrolimus* n. sp., and of the disease caused by it to larval *Dendrolimus sibiricus*. *D.s.*, an egger, is a serious pest in Siberian (including arctic) coniferous forests. ***Copy seen:*** DLC.

55321. TALMUD, IZRAIL' L'VOVICH, 1902– . Alûminiĭ iz nefelina. (Nauka i zhizn', Apr. 1957. god 24, no. 4, p. 14–16, illus., col. plate.) Text in Russian. ***Title tr.:*** Aluminum from nepheline.

With a scarcity of bauxite in the U.S.S.R., recovery of aluminum oxide from nepheline, which occurs in great quantity in the Kola Peninsula, was worked out by the Volkhov Aluminum Plant. The processing of the nepheline is described in detail and compared with that of bauxite. Bauxite usually contains about 45–56 percent Al_2O_3, nepheline only about 30 percent. In producing one ton of Al_2O_3 from bauxite, there are about 2–2½ tons of scrap. With the new nepheline process for each ton of Al_2O_3, there are 0.9 ton of sodium and potassium carbonites plus 9 tons of portland cement, essential to the Soviet construction program. Moreover, a certain amount of the rare metal gallium required in industry (semi-conductors) is also separated in this process.

55347. TAYLOR, R. J. F. The breeding and maintenance of sledge dogs. (Polar record, May 1957. v. 8, no. 56, p. 429–40, illus., tables.) 19 refs.

Account of studies on dogs (approx. 75) at Hope Bay, Graham Land, in 1954–55. Origin (from Labrador 1945–46, Greenland 1954) and breed are explained, and data presented on sex, working history, and character of the animal. Those of the Labrador stock (in third Antaretic generation) are compared with recent Greenland imports. Care and training, life history, breeding policy at Hope Bay, growth of the dogs, color, etc. are reported. Psychological traits are discussed in relation to trail performance and breeding policy. Comparisons are made with mechanical transport, performance and cost-data given. Though their utility is declining, dogs are still of considerable use on polar expeditions both as transport and laboratory animals. ***Copy seen:*** DLC.

55348. TAYLOR, R. J. F. The physiology of sledge dogs. (Polar record, Jan.

1957. v. 8, no. 55, p. 317–21, illus.) 10 refs.

Account of investigation conducted at Hope Bay, Graham Land, on some 75 dogs mostly from Labrador stock now in third Antarctic generation. Sledging diet and work output were studied. Digestibility and absorption of beef and whale pemmican and of their components, vitamins, etc., are discussed. Work output is analyzed: maximum "useful" work output and its conditions, power/weight ratio in dog muscle; psychological factors are considered.

55351. TAYLOR, RICHARD SPENCE. Physical characteristics and mechanics of certain depressed-center stone rings in northwestern Greenland. (Geological Society of America. Bulletin, Dec. 1957. v. 68, no. 12, pt. 2, p. 1804.)

Abstracts paper presented at the Society meeting in Atlantic City, Nov. 1–3, 1957. Describes stones pushed up on the borders by frost action and depressed in the center by thawing. The process is outlined and possible cause suggested.

Copy seen: DGS.

55352. TAYLOR, RICHARD SPENCE. A study of some high-latitude patterned-ground features. St. Paul, Minn., 1956. 229 p. illus., tables, graphs, map. 106 refs. Ph. D. thesis to Univ. of Minnesota. Microfilm: University Microfilms, Ann Arbor, Mich., Pub. no. 22,499.

Reports results of detailed studies 12 mi. southeast of Thule, northwest Greenland, on the physical characteristics and the hydrologic and thermal regimes of patterned-ground formations, having raised and depressed centers. Stones and granules concentrate at the surface and in the borders by direct congeliturbation, while fines concentrate in the center near the frost table by eluviation and preferential congelifraction. Repeated freezing and thawing causes the formation of a gutter under the borders and a basin under each mesh, and freeze-up from all directions toward the center. Each mesh constitutes a closed-system hydrologic cell in autumn. A heat cell (latent heat) forms in the center of each mesh during freeze-up, and a cold cell forms in each mesh in winter and early spring. Ice growth between stones and frost-table fluctuations sort and orient the stones radially. Moisture moves to the freezing surface and is withdrawn downward and laterally to form an ice layer on the frost table, which is responsible for most of the vertical movement. Dehydration of the middle layer reduces heave and inhibits cryostatic-pressure phenomena.—From SIPRE. ***Copy seen:*** DLC.

55355. TAYLOR, WILLIAM E., *Jr.* Archaeological work in Ungava, 1957. (Arctic circular, 1957, *pub.* Jan. 1958. v. 10, no. 2, p. 25–27.) Ref.

Surveys and limited excavations were made by the writer and wife at Payne Bay, Payne Lake, and Sugluk Inlet, Northern Quebec, July–Oct., under auspices of the National Museum of Canada. Artifacts were excavated from a Dorset culture site at the mouth of Payne Bay. Six sites on Payne Lake were tested, four of them Dorset. One of 40 Dorset houses was excavated. On Sugluk Island in Sept., trenches were made in five Dorset and two Thule culture sites. Two Sugluk Dorset sites showed similarities to T–1 site on Southampton Island which, by carbon-14 dating, was occupied 2,000–2,500 yrs. ago. Two other sites appear younger, but still Dorset in age. The fifth Dorset site and two Thule sites did not produce enough material for age estimates. ***Copy seen:*** DLC.

55356. TAYLOR, WILLIAM E., *Jr.* Archaeology in the Canadian Arctic. (Canadian geographical journal, Sept. 1958. v. 57, no. 3, p. 92–95, illus.)

Surveys past and present progress of archeological work in this area. Origins, migrations and cultures of aborigines are discussed: an early culture, provisionally termed "Sarqaq", and possibly extending to 2,000 B.C. was replaced in turn by Dorset and Thule cultures. Indications that the Thule, Dorset and possibly "Sarqaq" peoples migrated east from Alaska reinforce the theory of Asiatic origins. ***Copy seen:*** DGS.

55361. TEDLIE, W. D. Geology of the Barlow Lake area, Granville Lake mining division. Winnipeg, 1958. 23 p., 2 maps, incl. 1 fold. in pocket, table. (Manitoba. Dept. of Mines and Natural Resources. Mines Branch. Publication 57–2.) 4 refs.

Report, based on work in field season June–Sept. 1957, when area was covered by shoreline canoe traverses, and by pace and compass traverses; the geology is plotted on map, scale 1 in.=½ mi., base constructed from vertical aerial photos. Map area, 56°45′ – 57° N. 99°30′ – 99°45′ W., covers about 165 sq. mi., 45 miles east of Lynn Lake. The southern and eastern parts are covered by extensive deposits of glacial drift; the northwestern has pronounced relief (300–400 ft.) for this region. All consolidated rocks are Precambrian: folded and metamorphosed sedimentary rocks, with minor lenses of pyroclastics. Relative ages of lithologic units are illustrated in the table; distribution of units and geologic features are shown on map. Recent and Pleistocene deposits consist of peat, sand, gravel, and clay. Glacial erosion appears less intense than expected. The granitic intrusion in the central part of the map area has acted as a blunt wedge, in the north, deflecting trends to the northeast, and in the south toward the southeast. No major deposits of economic value were found; two minor occurrences of pyrite and molybdenite, and traces of sulphide mineralization were noted. ***Copy seen:*** DGS.

55362. TEDROW, JOHN CHARLES FREMONT, 1917– , *and* L. A. DOUGLAS. Carbon 14 dating of some arctic soils. New Brunswick, N.J., Rutgers University, Dept. of Soils, 1958. 6 p. Mimeographed. refs.

Gives results of carbon-14 dating of two samples of upland tundra soils and one of arctic brown from North Alaska. Samples of the former were taken from Umiat at approx. 700 ft. altitude and from Pt. Barrow at about 20 ft. Profiles to 60 in. depth for the Umiat soil and 30 in. for the Pt. Barrow show presence of organic matter in the upper permafrost. Age determination of this matter may throw light on how it was deposited; mineralogical, chemical and physical analyses are planned, and from combined data interpretations will be made. From C–14 dating results on an arctic brown sample from Pt. Barrow, it was found to be of great age (2900±130 yrs.); is thus in equilibrium and not likely to develop into a podsol. ***Copy seen:*** CaMAI.

55363. TEDROW, JOHN CHARLES FREMONT, 1917– *and* J. E. CANTLON. Concepts of soil formation and classification in arctic regions. (Arctic, 1958. v. 11, no. 3, p. 166–79, illus., diagrs.) 29 refs.

Discusses, on basis of studies in northern Alaska, soil forming processes in arctic regions and considers the relation between vegetation and soils and problems of classification and mapping. Tundra soils are poorly drained, mineral in nature, and underlain by permafrost at depths of 1–2 ft. Arctic brown soils form under free drainage, are mineral in character, and confined to ridges, terrace edges, and stabilized dunes. The active layer in such soils is usually deep. Downslope movement and frost action tend to disrupt any orderly morphology in both wet and well-drained sites. Moisture conditions in arctic soils exert a marked selective influence on vegetation.—From SIPRE.

55364. TEDROW, JOHN CHARLES FREMONT, 1917– , *and others.* Major genetic soils of the Arctic Slope of Alaska. (Journal of soil science, Mar. 1958. v. 9, no. 1, p. 33–45, illus., profiles, diagrs.) 17 refs. *Other authors:* J. V. Drew, D. E. Hill, *and* L. A. Douglas.

"The genetic soils of arctic Alaska can be arranged in a drainage catena. The mature soils on well-drained sites are arctic brown and related soils. The tundra profile is an imperfectly- to poorly-drained catena member. The bogs, with permafrost, occupy many of the broad,

flat, very wet areas. No evidence of a qualitative soil-forming process unique to the arctic areas is found. Instead, the arctic tundra is primarily a northern extension of the hydromorphic soils of the forested regions, whereas the arctic brown and related soils represent the northern extensions of the podzolic process. The term tundra, when used in connexion with zonal great soil groups along with podzols, chernozems, laterites and related soils, is an erroneous one and its use, except for a hydromorphic soil, should be discouraged. The podzolic process on the stable, well-drained sites weakens northward, resulting in the successive development of podzols, minimal podzols, arctic browns, arctic browns shallow phase, and finally, no soil formation."—Authors' abstract.

The origin of loose gold-bearing rocks, found at Laurila on the Kemi River in northern Finland in 1836, remained inexplicable until the glacial history of the area was understood. The direction of ice transportation was established in 1920, and in 1939–40, the provenience of these rocks was systematically sought. First described as a coarse-grained dolomite with gangue minerals, the rock was determined to be a typical ankerite, a hydrothermal gangue material. Locally it is of no economic importance, but identification adds to knowledge of the widespread gold mineralization of northern Fennoscandia which is believed to be associated with late Karelian granitic intrusion. ***Copy seen:*** DLC.

Contains a discussion of the systematic position and subdivision of the group, description of *S. stellaris* s. lat., and a key to the subspecies and varieties. Variation of the four subspecies and four varieties is discussed, and descriptions given with Latin diagnoses, synonyms, types, illustrations, data on distribution and extensive lists of specimens arranged as: Arctic, Subarctic and Central-European. The area of the *S. stellaris* group covers practically all arctic regions (maps 1–2). Data on comparative morphology, anatomy, cytology and phylogeny are added. *S. stellaris* s. lat. consists of four subspecies, *stellaris, alpigena, comosa,* and *prolifera.* The ssp. *alpigena* comprises four varieties, *alpigena, augustifolia, obovata* and *hispidula;* there are some intermediary geographic races between some subspecies. Subspecies *alpigena* and *prolifera* have the chromosome number 2n=28. ***Copy seen:*** DLC.

55375. TENER, JOHN S. The distribution of muskoxen in Canada. (Journal of mammalogy, Aug. 1958. v. 39, no. 3, p. 398–408, tables.) 17 refs.

Muskoxen, never abundant in Canada, were drastically reduced in numbers and distribution after firearms and fur trading were introduced. Data (numbers,

511326—60——73

district) are given on Hudson's Bay Co. muskox skin trade 1862–1916. In 1917 complete protection was introduced. Present distribution and the numbers on the mainland (Thelon Game Sanctuary on Bathurst Inlet region) and on various arctic islands are given in turn. The population, 500 in 1930, is estimated now at about 1,500 on the mainland and 3,500 on the islands. Information gathered 1950–1955 indicates reoccupation of former range as well as increase in numbers.

55377. TERASMAE, J. Contributions to Canadian palynology, part III; non-glacial deposits along Missinaibi River, Ontario. Ottawa, Queen's Printer, 1958. p. 29–35, fold. diagr., tables. (*In:* Canada. Geological Survey. Bulletin 46.) 7 refs.

Based on pollen analysis of samples from buried, non-glacial Pleistocene deposits, collected by O. L. Hughes in 1954, for radiocarbon determinations in connection with a stratigraphic study of exposures along the Missinaibi (approx. 50°30′ N. 81°20′ W.). Palynological studies, the inferred cool climate, and the short non-glacial interval, indicate that these buried peat deposits do not belong to the Sangamon interglacial stage; radiocarbon determinations indicate an age of more than 38,000 years.

Report on rendering onion cells frost-hardy contrary to the opinion held that the onion is an "unhardy" plant. Outer epidermal cells of the scale leaves were made frost resistant, by exposure to 0° C. for 2-3 weeks. Also dehydration in some hypertonic media had a similar effect. ***Copy seen:*** DLC.

55390. TERUMOTO, ISAO. The relation between cell sap concentration and the frosthardiness of the table beet. (Teion kagaku, 1958. v. 16, ser. B, p. 7–22, illus., tables.) 12 refs. Text in Japanese. Summary in English.

Account of histochemical studies on beet organs exposed to cold (O° to −5° C.). Phosphorylase activity in leaves and petioles of old plants increased with cold exposure and hardening, parallel to the sap concentration. In young plants there was no clear increase of this activity in leaves and roots, and in frozen plants it actually decreased. Low temperature also raised acid-phosphatase activity in petioles of every growing stage. ***Copy seen:*** DLC.

55391. TERUMOTO, ISAO. The relation between the activity of phosphorylase and the frost-hardiness in table beet. (Teion kagaku, 1957. v. 15, ser. B., p. 31–38, illus., tables.) 8 refs. Text in Japanese. Summary in English.

A study of phosphorylase and acid phosphatase activity as influenced by frost hardiness. Phosphorylase activity in leaves and petioles but not in roots increased with cold-hardening; it became stronger through prolonged freezing at −2° to −4° C. Acid phosphatase activity, found in all tissues, also increased through cold-hardening (exposure), and was not lost by de-hardening as was the case with phosphorylase. ***Copy seen:*** DLC.

55393. TEWELES, SIDNEY. Anomalous warming of the stratosphere over North America in early 1957. (U.S. Weather Bureau. Monthly weather review, Oct. 1958. v. 86, no. 10, p. 377–96, 14 diagrs., 11 text maps.) 32 refs.

The anomalous stratospheric warming of January and February 1957 is studied

in detail by means of constant pressure charts, time sections, and cross sections. The warming occurred as the meandering arctic stratospheric jet stream of wave number two developed into a pair of vortices extending to above the 10-mb. surface. It is concluded that development of stratospheric waves in the Northern Hemisphere is facilitated by autumnal growth of a forced perturbation locked in place by a warm ridge over the Aleutian area. Interaction between the tropospheric jet stream and arctic stratospheric jet stream during the period of development is believed responsible for the great intensity of the 1957 warming.—From author's abstract.

55394. TEWELES, SIDNEY. Temperature and wind fields at the time of noctilucent clouds in Alaska, July 27–28, 1957. (U.S. Weather Bureau. Monthly weather review, Aug. 1957. v. 85, no. 8, p. 281.)

Most noctilucent clouds are observed at elevations of 65 to 90 km. in the vicinity of the mesopause between ozonosphere and ionosphere. Wind flow at 50 and 25 mb during cloud observation described by W. B. Lindley, q.v., was easterly, 5–10 knots; winds increased upwards through the layer; the temperature field was weak; a weak trough moved west-east across the area. An explanation of the clouds may be found in the apparent general convergence in the vicinity of the trough in a deep layer extending above the 50-mb level.

In 1956, Sweden's railway centennial, low passenger rates induced many people to travel within the country. Among other features of the year, the inland railway and its surroundings in Norrland, northern Sweden, are included in the discussion. The area is likened to neighboring Finland. ***Copy seen:*** DGS.

55399. THIEL, E., *and others.* The thickness of Lemon Creek Glacier, Alaska, as determined by gravity measurements. (American Geophysical Union. Transactions, Oct. 1957. v. 38, no. 5, p. 745–49, illus., diagrs., map.) 4 refs. *Other authors:* E. LaChapelle *and* J. Behrendt.

Presents results from 182 gravity stations on this glacier in the Juneau Ice Field (58°35′ N. 134°15′ W.) in summer 1956. Cross-sectional profiles are given and an isopach map, constructed from the appropriate ice-rock density differ-

ential to fit observed variations in the Bouquer anomaly on traverses across the glacier. The maximum ice thickness is in the upper central reaches. Average longitudinal slope of the surface is 3.5° at midglacier, increasing to 6.3° toward the icefall; the slope of the underlying rock surface is 2.4° and 4.6°, respectively. The gravity method (though less accurate than seismic) is recommended for glacier thickness studies where equipment and field work must be curtailed.

55401. THOMAS, BRUCE I. Tin-bearing deposits near Tofty, Hot Springs district, central Alaska. Washington, D.C., 1957. iii, 56 p., diagrs., maps, tables. (U.S. Bureau of Mines. Report of investigations 5373.)

Presents results of 1954–56 investigations of a tin belt at 65°05′ N. 151°00′ W., to indicate its tin-production potential and determine the lode sources of the placer minerals. Eighty-two holes were drilled, and 11 tailing pipes were trenched; deposits were estimated at 733,000 lbs. tin and 17,700 oz. gold, plus a variety of other minerals in small amounts. Accessibility, physical features and climate, history and production through 1956 (gold, silver, cassiterite), property and ownership, water supply, geology, physical characteristics and mineralization, and laboratory investigations are described in turn. Topography is mapped in detail, placer sections are illustrated; data are tabulated on drilling and sampling results, and on the spectrographic analyses. ***Copy seen:*** DI.

55402. THOMAS, CHARLES W., 1903– . Antarctic navigation. (Navigation, Autumn, 1957. v. 5, no. 7, p. 345–48, illus.)

Illustrated by examples of experiences with the icebreaker *Northwind* and the supply ship *Arned* during Operation Deepfreeze (1956–57), some hints are given for polar navigation. The importance of an understanding of Coriolis force and the significance of the ability to recognize signs in flora and fauna are stressed. Examination of bottom sediments was used to determine in advance the suitability of an ice field for an emergency landing strip.

55405. THOMAS, J. F. JAMES. Churchill River and Mississippi River drainage basins in Canada, 1952–54. Ottawa, 1958. 53 p. 3 maps, incl 2 fold., in pocket, 4 diagrs., 6 tables (Canada, Dept. of Mines and Technical Surveys. Mines Branch. Report no. 858: Industrial water resources of Canada, Water survey report no. 9.) Refs. in text.

Outlines results of investigation, including field studies, 1952–54, of the chemical quality of surface and municipal water supplies available for industrial and domestic use in these two river basins. The Churchill drainage basin (1953–54) and the water systems of Fort Churchill, Man. and Bonnyville, Alta. are described (p. 35–53) with tabular

data, chemical analyses of surface waters at 26 stations and of the two municipal systems. The supply of water is plentiful; relatively hard in the plains region; requires little treatment.

Copy seen: DGS.

55406. THOMAS, J. F. JAMES. Mackenzie River and Yukon River drainage basins in Canada, 1952–53. Ottawa, Queen's Printer, 1957. 78 p., 2 maps (1 fold.), 6 tables, 4 graphs. (Canada. Dept. of Mines and Technical Surveys. Mines Branch. Report no. 856: Industrial water resources of Canada, Water survey report no. 8.)

Discusses chemical quality of waters available for industrial and domestic use in the large area drained by these two rivers and their tributaries. Basins of the two rivers are described. Graphs show water hardness, turbidity, seasonal variation in chemical quality, relation between mineral content and river flow. Tables summarize area and population distribution; chemical analyses of surface waters and of municipal water supplies. Data on municipal systems, treatment, population served, and water hardness are presented. Municipal water systems for 21 communities in the Mackenzie and two in the Yukon basin are described. Location of sampling stations and of municipal water supplies is shown on fold. map. General discussion of data is included. The area is of minor industrial importance; supplies of surface waters are adequate for most industrial and municipal purposes.

55407. THOMAS, JOHN H. The vascular flora of Middleton Island, Alaska. (Stanford. University. Dudley Herbarium. Contributions, Nov. 1, 1957. v. 5, no. 2, p. 39–56, 2 illus.)

Contains some historical notes, data on the physical geography of this island (59°26′ N. 146°20′ W.), and a systematic annotated list of 116 vascular plant species distributed among 42 families, based on the author's collection in June and August of 1956. The vegetation is mainly low and herbaceous. One tree, *Picea sitchensis* and three species of shrubs, *Salix barclayi*, *Rubus spectabilis*, and *Sambucus racemosus* ssp. *pubens* make up the conspicuous woody vegetation. Nine species have been introduced possibly by the fox ranchers who lived there till about 1930. The flora of Middleton Island probably derived from the islands (Hinchinbrook and Montague) and mainland to the north.

THOMAS, LEO ALMOR, 1917– , *see* Lindholm, G. F., *and others*. Geologic and engineering properties of silts . . . *1957*. No. 52840.

55408. THOMAS, MORLEY K., *and* **R. L. TITUS.** Abnormally mild temperatures in the Canadian Arctic during January 1958. (U.S. Weather Bureau. Monthly weather review, Jan. 1958. v. 86, no. 1, p. 19–22, 2 text maps, 2 tables.) 4 refs.

Describes occurrence of record maximum temperatures in western and (especially) northeastern Canada. Readings of 40° F. at Arctic Bay, 32° F. at Alert, 30° F. at Eureka, are the only occurrences of near- or above-freezing temperatures in January, reported from 70° latitude; these temperatures are higher than any previously recorded during the six months period, November–April. Synoptic characteristics of January 1958 weather are noted; abnormally high temperatures prevailed aloft as well as at the surface. The abnormality is attributed to the northward movement of low pressure systems over Baffin Island.

Copy seen: DWB.

55409. THOMAS, MORLEY K., *and* **D. W. BOYD.** Wind chill in northern Canada. (Canadian geographer, 1957. no. 10, p. 29–39, 10 text maps, graph, table.) 9 refs.

Discusses problems of measuring coldness. Using Siple's formula (No. 16134), monthly values of the wind chill factor were obtained from monthly mean values of air temperature and wind speed at Canadian arctic and subarctic stations. Maps show for all Canada: mean temperature (F.) for Jan.; extreme lowest recorded temperatures 1921–1950; mean wind speed (mph.) in Jan.; mean wind chill factor (kg. cal./m.^{2}/hr.) in Jan., Apr., July, Oct. and annually; mean annual number of degree days. Monthly and annual wind chill factors data are tabulated for Churchill, Chesterfield, Baker Lake, Resolute, Alert, Snag, also for two Antarctic stations. Chesterfield and Baker Lake have highest wind-chill

values in mid-winter closely followed by the Antarctic stations.

55410. THOMAS, MORLEY K. Winter season snowfall data. Ottawa, Dec. 16, 1957. 20 p. tables. Mimeo. (Canada. Meteorological Branch. Circular 2994, CLI–17.) 34 refs.

Survey of snowfall data; its accuracy, and interpretation, snowfall measurement. Data including such from about 50 stations in the Arctic, are appended. Snowfall occurs at every weather station in Canada; some northern stations have recorded snow during every month of the year. ***Copy seen:*** DWB.

55411. THOMPSON, HUGH RALPH, 1926– . The old moraines of Pangnirtung Pass, Baffin Island. (Journal of glaciology, Mar. 1957. v. 3, no. 21, p. 42–49, 4 illus., text map, cross-section.) 16 refs.

Results of observations made during the 1953 Baffin Island Expedition of the Arctic Institute of North America. Most convincing signs of past glaciation in Pangnirtung Pass (66°06′ N. 65°59′ W.) are the so-called "old moraines." Various hypotheses as to their origin are considered. The features are probably of complex origin, but consist primarily of moraines deposited by trunk glaciers flowing in the Pass. Deposits have been reworked and dissected by rivers; melting of ice cores in the moraines has further complicated topography. Disappearance of the trunk glaciers is tentatively estimated at 500 A.D. At least two main advances of the tributary glaciers have occurred, one closely following disappearance of the trunk glaciers, the other not later than 1850. ***Copy seen:*** DGS.

55412. THOMSEN, BRUNO. On sand samples from the west coast of Greenland 1: an examination of the contents of minerals in a number of sand samples from the northern part of the Holsteinsborg District. København, C. A. Reitzel, 1957. 25 p., plate, maps, tables, graphs. (Meddelelser om Grønland, bd. 157, nr. 2.) 12 refs.

"Forty-one samples of sand from rivers and beaches from three fjords north of Holsteinsborg were analyzed. On the basis of the minerals of the heavy fractions, the samples may be divided into three groups: group E derived from enderbitic gneiss with the main minerals, hornblende, hypersthene, and diopside, while garnet plays a secondary role only; group G chiefly derived from granulitic rocks where garnet is dominating with sillimanite and rutile as characteristic components, while the content of hornblende, hypersthene, and diopside is relative low; and finally group M, that with the main minerals, hornblende, hypersthene, diopside, and garnet and a slight content of sillimanite and rutile shows that the sample material derives from enderbitic as well as granulitic rocks."—Author's abstract.

55415. THOMSEN, S. Experience on Northwest Highway System shows muskeg increases road costs two to three times. (Roads and engineering construction, Apr. 1957. v. 95, no. 4, p. 101–104, 148–50, illus.) Ref. in text.

Discusses construction, maintenance, and economic problems connected with muskeg along the Alaska Highway. Ways of overcoming these problems by displacement or excavation, or by flotation methods are weighed, and economics involved in construction and maintenance of the gravel road by grading during settling in the muskeg, are discussed. One consolidation test indicated a settlement of 50% of the depth under a load of 1 ton/sq. ft. Successive ice sheets, building formations up to 10 ft. thick and 0.25–0.50 mi. long, create driving hazards, and heavy maintenance is necessary for the first years for roads built over organic terrain. ***Copy seen:*** DLC.

55416. THOMSON, ANDREW, 1894– . Lowest temperature in Canada.

(U.S. Weather Bureau. Monthly weather review, Aug. 1958. v. 86, no. 8, p. 298.)

Comment on No. 55156 and clarification of apparent discrepancy in temperature record. Lowest temperature recorded in Canada was −81° F. at Snag, Yukon Territory, Feb. 3, 1947.

Copy seen: DWB.

55417. THOMSON, J. G. Winter roads over muskeg. (Canadian mining and metallurgical bulletin, Mar. 1957. v. 50, no. 539, p. 159–62.) *Also pub. in* Canadian Institute of Mining and Metallurgy, Transactions, 1957, v. 60, p. 101–104.)

Describes recommended methods of construction of winter roads, based on experience of pulp and paper mills in northern Ontario; methods which result in a recoverable road, usable for as long as ten years. Route selection, provision of usable pavement and subgrade, and frequent and prompt maintenance are discussed. Miscellaneous procedures which may add to the strength or life of the road, reduce costs, etc., are noted; methods of conversion to all-weather road are mentioned. ***Copy seen:*** DGS.

55418. THORÉN, RAGNAR. Fotografisk rekognoscering och tolkning av havsisen i Arktis. (Ymer 1958. årg. 78, häfte 4, p. 263–79, illus., map.) 17 refs. Text in Swedish. Summary in English. ***Title tr.:*** Photographic reconnaissance and interpretation of sea ice in the Arctic.

Photointerpretation as a science was introduced by the author at the International Society of Photogrammetry's world congress at the Hague in 1948. Its Commission VII, Photographic interpretation, was organized and divided into six working groups, one of them for interpretation of ice. The importance of this science is discussed. Four oblique aerial photographs showing different parts of the Arctic Basin and taken by the author at night, May 23–24, 1958, with a Swedish-built Hasselblad camera are presented and interpreted. The general movements of the ice in the eastern and western parts of the Basin are described as well as different types of ice (Siberian ice, north polar ice, ice islands). The different ice conditions in the eastern and western parts of the Basin due to the influence of the Gulf Stream in the latter are treated in some detail.

Contains account of a Canadian Geological Survey reconnaissance of western Ellesmere and eastern Axel Heiberg Island carried out during Apr.–Sept. 1956. The various journeys from Eureka by dog sled, on foot, and by powered canoe are reported in detail with information on the snow and ice conditions encountered and mention made of an unexpected shore ice condition on the east side of Eureka Sound. Eskimo remains were found on both islands: tent rings, animal traps, sled runners, and a tomb. Wildlife observed is listed in appendix with note of numbers, localities, etc. Geological results are outlined and the previous geologists' work on rocks of Ordovician, Silurian, Pennsylvanian, Permian, Triassic, Jurassic, Cretaceous and Tertiary ages are described. Special emphasis is given to structural features, Tertiary rocks affected by deformation cover a greater area than formerly believed and lie in a belt east of rocks affected by Paleozoic deformation. Thrust faulting, unconformities, and gypsum piercements are considered.

55431. TIKHOMIROV, BORIS ANATOL'EVICH. Dannye o poleznykh rasteniiakh ėskimosov iugo-vostochnogo poberezh'ia Chukotki. (Botanicheskiĭ zhurnal, Feb. 1958. t. 43, no. 2, p. 242–46.) 34 refs. Text in Russian. ***Title tr.:*** Data on useful vegetation of

Eskimos of the southeast coast of Chukotka.

Reviews Russian and Western literature on edible and medicinal plants known to coastal Chukchis, Yakuts and Eskimos, noting the northward diminishing toxicity of poisonous flora. Plants used primarily for food by the Eskimos of Chaplino were studied by author during his botanical investigations of Chukotka's hot-spring region, in summer 1956. A list is given of lower (three families) and vascular plants arranged in 17 families, with notes on species, vernacular names, and uses. Most of the useful plants belong to the families Polygonaceae (four species), Leguminosae (two), Rosaceae (five), and Vacciniaceae (two). The nutritional value of these plants eaten raw and/or boiled is discussed. The study of food and medicinal plants used by Asiatic and American Eskimos is suggested as a possible clue in tracing their ancestral relationship. ***Copy seen:*** DLC.

55432. TIKHOMIROV, BORIS ANATOL'EVICH. Dinamicheskie îavleniîa v rastitel'nosti pîatnistykh tundr Arktiki. (Botanicheskiĭ zhurnal, Nov. 1957. t 42, no. 11, p. 1691–1717, 13 illus., 3 tables.) 54 refs. Text in Russian. ***Title tr.:*** Dynamic phenomena in the vegetation of spotted tundras in the Arctic.

Study, based chiefly on investigations in the central Taymyr Peninsula, of spotted tundras as an element of the natural complex of arctic vegetation, and of their characteristic structural features. At least six different types of spotty tundras can be distinguished: *Dryas punctata*+*Cassiope tetragona*+*Carex hyperborea*+miscellaneous green mosses; *Carex hyperborea*+*Dryas punctata*+miscellaneous green mosses; etc. Characteristics of the soil regimes of different parts of such tundras are given (table 1). The main types of spotted tundras and features peculiar to their vegetation are discussed and figured (fig. 7–12). Wind and corrasion of the snow cover are the principal factors contributing to tundra denudation. Regeneration of the vegetation on bare spots of spotted tundra is a slow process, in which cryptogams and bacteria play the leading part. Bacteria come first, followed in turn by algae such as *Stratonostoc commune* (chemical analyses table 2–3), green mosses, liverworts and lichens (listed), and (later) flowering plants. These two processes, the denudation of the tundra and re-vegetation of bare spots, going on continuously and simultaneously, are the most important phenomena of the dynamics of spotted tundra vegetation. ***Copy seen:*** DLC.

55433. TIKHOMIROV, BORIS ANATOL'EVICH. K kharakteristike flory i rastitel'nosti termal'nykh istochnikov Chukotki. (Botanicheskiĭ zhurnal, Sept. 1957. t. 42, no. 9, p. 1427–45, 9 illus., table.) 29 refs. Text in Russian. ***Title tr.:*** On the character of the flora and vegetation of the hot springs in the Chukotsk Peninsula.

Six groups of hot springs in the area 64°26′–66°51′ N. 171°30′–172°63′ W. are considered: environmental conditions briefly characterized, and main features of the vegetation discussed with reference to many flowering plants, trees and shrubs, lichens and mosses, the group of thermophytes and halophytes being especially noted. The activity of the suslik, a ground squirrel, *Citellus undulatus*, and its influence on the vegetation are discussed. The hot-spring flora of the southeastern section of the peninsula is comparatively rich, with predominance of moderate boreal elements (trees, shrubs and herbaceous species) and the role of arctic species insignificant. This region may be considered a relict of the flora of Asian Beringia, resembling that of the St. Lawrence Bay. Appended is summary table of the vascular thermophytes (Chaplinsk and Senyavinsk groups in the Chukotka and Kamchatka hot springs), with ecological and distributional data. A special study of hot springs for medicinal purposes and industrial use (vegetable hothouses) is recommended. ***Copy seen:*** DLC.

55434. TIKHOMIROV, BORIS ANATOL'EVICH. Nekotorye zadachi izucheniîa rastitel'nogo pokrova Sovetskoĭ Arktiki. (Akademiîa nauk SSSR. Vestnik, July 1958. god 28, no. 7, p. 45–48.) Ref. Text in Russian. ***Title tr.:*** Some objectives in study of the vegetation of the Soviet Arctic.

Investigation of the vegetation in the Soviet Arctic needs to be substantially extended (despite recent progress), especially in Siberia: eastern coastal regions of Taymyr Peninsula, the area between the lower Lena and Chaunskaya Bay, the Cherskiy, Verkhoyanskiy, Anadyrskiy, Koryakskiy Ranges; forest-tundra areas especially need increased study. An Academy of Sciences scientific station at Lake Taymyr and several observation

points in other arctic localities should be set up. ***Copy seen:*** DLC.

55435. TIKHOMIROV, BORIS ANATOL'EVICH. O nesushchestvovavsheĭ ėkspeditsii Benkendorfa na r. Indigirku. (Vsesoûznoe geograficheskoe obshchestvo. Izvestiâ, Mar.–Apr. 1958. t. 90, vyp. 2, p. 163–66.) 14 refs. Text in Russian. ***Title tr.:*** On the non-existent Benkendorf expedition to the Indigirka River.

Discloses that this expedition of 1846 for investigation on the mammoth cited in the literature for more than a century, should be considered as non-existent in accordance with proved facts; hence Benkendorf's "finds" and "contribution" on the nourishment of the Siberian mammoth are entirely misleading. Rectification of this matter is attributed to E. D. Zaklinskaâ (No. 33020) and others cited; new sources are discussed.

Doklady, Mar. 11, 1957. t. 113, no. 2, p. 421–24, text map.) 5 refs. Text in Russian. ***Title tr.:*** New data on the stratigraphy and tectonics of the right bank of the Kolyma River in its lower reaches.

The stratigraphic structure of the Anyuy Range and Oloyskiy deflection in the Chauna Bay region on the East Siberian Sea coast is schematically represented. The Anyuy folding system may be divided into three principal structural elements: northern and southern anticlinal zones and a central synclinal zone, consisting of Precambrian, lower Paleozoic and Mesozoic deposits. The more detailed structure is shown (text map). The peculiar features of Anyuy folding zone are the absence of pyroclastic formations and numerous intrusions of granodiorites. On the south it is adjoined by the Oloyskiy trough of Upper Jurassic—Lower Cretaceous age. Its lower part consists of sandy limestones and tufaceous sandstones with numerous *Aucella* species, overlain by Upper Cretaceous formations of sandstones, bituminous shales, tuffs, and tufaceous sandstones with imprints of *Podozamites, Baiera, Cladophlebis, Phoenicopsis, Podocaroxylon* and *Protocedroxylon* species.

The effects of severe conditions in the far North on the construction and operation of electrical networks are discussed. Permafrost, air temperatures to −51° C. in winter, winds to 37 m./sec., and the heavy moisture content of the subsoil are the most important factors; new construction methods are required. The high resistance of frozen ground makes it unsuitable for grounding of wires, which should be extended to the bottom of unfrozen water reservoirs or to thawed islands in the frozen strata. The soil around poles should be covered by moss, peat, or other thermo-insulating materials to protect the poles from frost heaving.

Heaving of the ground can be eliminated by reduction of moisture around the poles or by preservation of the permafrost conditions during periods of thaw. The pole holes should be made by the steam needle method or drill of the same diameter as the pole. The electric equipment and especially oil switches should be placed in a closed compartment and air around them warmed to temperature not above 0° C. in winter, also in spring and fall, to diminish humidity. Transformers should be set up outside, even at air temperature of −35° C. Underground cable should be placed in conduits for protection against ground deformation, especially on slopes. Preservatives are not required for wood poles because of the low bacterial activity in permafrost areas. ***Copy seen:*** DLC.

Translated into English by John Miller, American Meteorological Society, for the Geophysics Research Directorate, Cambridge, Mass. Copy at CaMAI. ***Title tr.:*** Atlantic water in the Arctic Basin.

Analysis of data on: temperature, thickness, area, volume, heat content, currents (direction and velocity to 1,000 m. depth) and water discharge in the Barentsburg-ice edge hydrological section across the Greenland Sea. The main mass of Atlantic water, after crossing the Nansen Rise, between Greenland and Spitsbergen, travels eastward along the Eurasian continental slope at approx. 930 km./yr. or 2.9 cm./sec., as far as the Beaufort Sea, where it loses its heat content, increases in area and volume. The mean velocity for the complete passage around the Arctic Basin is calculated to be 375 km./yr. or 1.2 cm./sec.; thus the Atlantic water enters the Barents Sea in six months, the Kara Sea in 1.5 yrs., the Laptev Sea in 2.5 yrs., the East Siberian Sea in four years and the Chukchi Sea in five yrs. Water leaves the stream continuously along the way, moving northward toward the Pole and toward Greenland. After completing the circumpolar passage, the remaining water turns southward to join the East Greenland current. Thickness of the Atlantic water layer varies irregularly from 694 m. as it crosses the Nansen Rise, to 512 m. as it turns to join the East Greenland current. Data are tabulated by sectors and depths; maps show distribution of mean and maximum temperature, thickness of the layer, depth of maximum temperature, and a schematic chart of the circulation pattern.

Having reviewed the ideas of Nansen and P. P. Shirshov on the problem, author maintains, on the basis of temperature and salinity, that this water is formed in the Greenland Sea during fall and winter. Thence it moves across the Nansen Rise and sinks into the Basin. Some of this water may have origin in the Atlantic or in the seas bordering the Arctic Basin. ***Copy seen:*** DLC.

55448. TIMOFEEV, V. T. Priblizhennoe opredelenie teplovogo balansa vod Arkticheskogo basseĭna. (Problemy Arktiki, 1958. vyp. 4, p. 23–28, tables.) 5 refs. Text in Russian. ***Title tr.:*** Approximate determination of the heat balance of the Arctic Basin waters.

A physical-mathematical analysis of thermal gains and losses of the water mass and of the atmosphere above it, and the heat exchange between them, based on year-round observations. The role of thermal factors in ice formation, the significance of influx of Atlantic waters, etc., are also discussed. The annual heat gain is 507.474×10^{12} kcal., of which 42% is supplied by Atlantic waters, 7% is introduced by Pacific waters, and 2% by river water. The annual heat loss is 507.474×10^{12} kcal. of which 52% is lost to the atmosphere by arctic seas, 34% by the Arctic Basin, and 14% is carried out into the Greenland Sea.—From SIPRE. ***Copy seen:*** DLC.

Title tr.: Geological structure of the northern part of the central Siberian plateau.

Outlines relief, stratigraphy (p. 137–203), volcanism (p. 203–227), tectonics (p. 227–239), and mineral resources of the region (approx. 66°33′–71°30′ N. 86°–120° E.), which extends from the Yenisey River in the west to the Olenek-Lena watershed in the east. This comprehensive survey is based on field investigations and geological mapping in the last 20 years by many scientists (as attributed). The most studied area is around Noril'sk where deep borings have been made and geophysical methods applied. The northern part of Siberian platform is built of different formations of Archeozoic, Proterozoic and Sinian, as well as all Paleozoic groups and Lower Triassic. The stratigraphy of all these formations is outlined. Volcanic activity played an important role at several stages; and the various deposits are summarized in table (p. 209). Tectonics of the region were mainly determined by the Anabar anticline and Tungusska syncline. Coal is the most important mineral resource, deposited mainly in the Tungusska syncline. Prospects are noted for oil in Anabar anticline. Copper and nickel ores of the Noril'sk region are very rich. Other mineral resources are briefly mentioned. The geological map (1:2,500,000) which accompanies the volume covers this region.

An informative handbook, based on lectures during 20 years to students, but recapitulating, for the non-specialist, a large body of research results, primarily on the pre-Soviet period. The ethnographic classification is mainly according to principles of linguistic classification. Northern peoples are discussed among others: Karelians, Lapps, Komi: 60% Zyryans (p. 128–41); Yakuts and the northern minorities, viz: Ostyaks and Voguls, Samoyeds, Yeniseians, Tungus (Evenki, Dolgans, Golds, Ul'chi, Orochi, Udegeytsy, Oroki), Gilyaks, Yukaghirs, Kamchadals, Chukchis and Koryaks,

Eskimos and Aleuts (p. 409–557). For each people their distribution, vital statistics (1926, occasionally 1939 census), and ethnogenesis are given, together with data on exploration, economy, material culture (houses and settlements, clothing, transportation), social organization, survival of religious beliefs, folklore and crafts. Anthropological types, stages of cultural and economic development, reindeer herding and its origin are considered; attempts at acculturation by the tsarist regime, and socialist reconstruction of the minorities are discussed. Approx. 150 refs., mainly Russian works pub. prior to 1950, pertain to northern peoples; diagrams of race classification and a 1957 col. ethnic map (1:25,000,000) are included; lists of local words and expressions and ethnic terms are appended.

The book was discussed at a special June 1958 session of the Institute of Ethnography (*Sovetskaîa ėtnografiîa*, 1958, no. 6, p. 121–27) and Tokarev criticized for a dilettantist approach, for errors of fact, insufficient treatment of the Soviet period, incompleteness of bibliographic material, etc. ***Copy seen:*** DLC.

55470. TOKAREV, SERGEĬ ALEKSANDROVICH, 1899– . S. V. Bakhrushin, 1882–1950; nekrolog. (Sovetskaîa ėtnografiîa, 1950, no. 2, p. 222–23.) Text in Russian. ***Title tr.:*** S. V. Bakhrushin, 1882–1950, an obituary.

Biographical sketch of this Soviet ethnographer, with emphasis on his work on the history and social organization of the Siberian peoples, especially the Yakuts; some of his publications cited in the text. ***Copy seen:*** DLC.

55471. TOKAREV, V. Po Sibiri i Zapolîar'iu. (Sovetskaîa muzyka, Dec. 1958. god 22, no. 12, p. 106–110, illus.) Text in Russian. ***Title tr.:*** Across Siberia and beyond the Arctic Circle.

A member of the All-Russian guest-performance-concert union reports on their four-man tour of Siberia including the lower Yenisey region: Dudinka, Noril'sk, Ust'Port, Karaul, Igarka; and Taymyr Peninsula: Dikson Island, Dikson (town on mainland), Khatanga. Types of program, public response, means of transportation are mentioned.

55473. TOKMAKOV, P. P. Khrustalenosnye kvart͡sevye zhily zameshcheniîa i khrustalenosnye polosti perekristallizat͡sii Aldana. (Akademiîa nauk SSSR. Institut geologii rudnykh mestorozhdeniĭ, petrografii, mineralogii i geokhimii. Trudy, 1957. vyp. 10, p. 49–56, illus., tables.) 4 refs. Text in Russian. ***Title tr.:*** Replacement and recrystallization in cavities of crystalliferous quartz veins in the Aldan region.

The predominantly quartzite Tengra River series of local Archean is characterized. Three types of quartzites: massive, bedded sericite-sillimanite, and feldspathized quartzites are distinguished and outlined. Hydrothermal and solution processes of filling, replacement and recrystallization of crystalliferous veins are treated and illustrated by photos and diagrams. Growth and changes of quartz crystals, their color and substance are noted. ***Copy seen:*** DLC.

55474. TOLANSKSKY, S. Symmetry of snow crystals. (Nature, *London*, Jan. 1958. v. 181, no. 4604, p. 256–57.)

To explain the high degree of symmetry often seen in snow crystals, an hypothesis is advanced that the free crystal is vibrating as a flat plate, with a hexagonal symmetry. Formation of ice on one arm causes a damping of vibration at the corresponding positions of the other five arms and similar ice formation on them. The hypothesis is claimed to explain some other qualities of snow.

55475. TOLSTIKHIN, O. N. Termal'nye vody Kamchatki i problema ikh osvoeniîa. (Sovetskaîa geologiîa, Feb. 1958. god 1, no. 2, p. 109–133, 4 tables, text map.) 27 refs. Text in Russian. Summary in English. ***Title tr.:*** The thermal waters of Kamchatka and problems of their utilization.

Contains results from a five-man geological expedition in 1952 headed by the writer, along with materials from the Institute for Resorts Studies. Kamchatka has more than 80 regional groups of thermal springs caused by recent volcanic activity, the waters originating in sedimentary and volcanic rocks of the Upper Cretaceous, Tertiary and Quaternary. The waters from the Upper Cretaceous are warm, contain chiefly sodium hydrocarbonate with carbon dioxide gas, and their mineralization is up to 5 g./l. The thermal waters of Tertiary sediments contain sòdium chloride and hydrocarbonate especially with methane; their mineralization goes up to 12 g./l. Waters in Tertiary effusives have sodium sulphate with nitrogen, and mineralization up to 1 g./l. Recent volcanic waters are acid with pH below 27, with mineralization up to 5 g./l. and these have best prospects for utilization. Location, zones and type of the thermal waters are shown (map) and data of chemical analyses of Mesozoic, Tertiary sedimentary, Tertiary effusive and volcanic waters are given. Such waters may be utilized for electric power development, domestic, medicinal, agricultural, etc. purposes. But the most pressing need is their adaptation to household use in workmen's settlements, in view of the steadily growing population of Kamchatka. ***Copy seen:*** DLC.

Drifting station North Pole-4, life, work and main events there during Apr. 1954–Apr. 1955, are described by the head of its first team: setting-up of the camp at 75°48′ N. 181°35′ E. on Apr. 8; its personnel, transportation (helicopter, small aircraft and tractor), equipment and supplies, etc. The station drifted 2,600 km. during the first year; its bathymetric observations disclosed a minimum depth of 293 m. and maximum of 3,286 m.; hydrobiological observations, visits of polar bears, etc., are noted. Author's party was relieved by a new team under P. A. Gordienko, which in turn was relieved in 1956 by another team headed by A. G. Dralkin. ***Copy seen:*** DLC.

55478. TOLSTIKOV, EVGENIÏ IVANOVICH. Na l'dakh v okeane; iz dnevnika nachal'nika stanîsii. Moskva, Izdvo "Morskoĭ transport," 1957. 124 p., illus., ports, 6 plates, map. Text in Russian. ***Title tr.:*** On ice in the ocean; from notebook of chief of the station. Literary make-up by ÏU. Gal'perin.

Day-by-day notes of the head of the first party on the drifting station "North Pole-4," from their landing on the ice in the Arctic Basin on Apr. 8, 1954, till their relief by another team and flight back to the mainland on Apr. 16, 1955. The main events and work during the drift are recounted: selection of the ice floe for aircraft landings and for the camp of the station; setting up the tents and knock-down structures; the station's equipment: airplane, helicopter, tractor, etc., and air supply; personnel and their characteristics, health conditions and ailments; radio communication with the mainland;

organization of the scientific work: aerological, meteorological, bathymetric, hydrological, biological, magnetic observations. The struggle with melt-water in summer and with ice pressure and cracks in winter is noted. Data are given on location and on depths recorded. Maintenance and defects in clothing, dwellings and tents are mentioned (p. 54–55). Scientific work carried out during September (p. 64–65) and a brief summary of the year's meteorological data (p. 116–17) are presented. Visit of a team of artists on Apr. 12, 1955 is noted, p. 122–23. ***Copy seen:*** DLC.

Institut merzlotovedeniîa. Trudy, 1958. t. 14, p. 92–95, tables, diagrs.) ***Title tr.:*** Variations in soil temperature under wooden buildings as dependent on heating in general and the heating system in particular.

Results of studies 1953–56 in the Allaykhovskiy district (approx. 70° N. 147° E.) of Yakutia on the effect of heated wooden buildings on the temperature regime of frozen ground are reported; data are tabulated; and local soil characteristics are described. Soil temperatures were measured in bore holes 6.10–8.35 m. deep below and alongside a continuously heated building constructed on piles with the floor 0.20–0.25 m. above the ground and banked with soil on the sides, and another building resting directly on the ground with a dead air space of 0.10–0.20 m. below the floor. A sudden decrease in soil temperature was recorded below and around the first building as soon as heating was discontinued, the 0° C. isotherm rising from a depth of 1.2 m. to 0.5 m. and dropping to 0.8 m. when heating was resumed a month later. Under the second building, which was heated only during cold weather, soil temperatures increased in 1955 after a steam heating system was installed to 1.3° C. at a depth of 1 m. and −5.7° C. at 5 m., as against −1.3° and −7.3° C., respectively, in 1954.—From SIPRE.

55481. TOLSTOY, PAUL. The archaeology of the Lena basin and its New World relationships; part I and II. (American antiquity, Apr., July 1958. v. 23, no. 4, pt. 1, p. 397–418; v. 24, no. 1, p. 63–81, illus. tables, map.) Approx. 100 refs.

Pt. 1 is a review of the 1945–1955 neolithic finds in the Lake Baykal area and along the middle and lower Lena River, based mainly on A. P. Okladnikov's publications. The stone and early bronze artifacts and pottery are described for each culture sequence in turn, the culture areas defined, and the archeological sites mapped and tabulated. Pt. 2 deals with the evidence of Amerasian parallels, stressing the evidence of reciprocal influences. While certain features, e.g. core and blade tools, pottery, etc. originated, assuredly, in Siberia, other stone artifacts like lunate sideblades, long-stemmed and spurred points, etc. are, probably, of American Plains origin, and spread north- and westward to arctic Siberia through the intermediary of the Denbigh or related culture. A coeval occurrence of some lithic artifacts in the Baykal-Lena and the Archaic-Woodland cultures of eastern North America and the slow diffusion of pottery in the American North are discussed. The Siberian and American finds are compared and tabulated.

55482. TOLSTOY, PAUL. Some Amerasian pottery traits in north Asian prehistory. (American antiquity, July 1953. v. 19, no. 1, p. 25–39, table.) 77 refs.

Discusses neolithic decorative ceramic patterns of Eurasia, including the Lake Baykal, Lena and Kolyma River areas, and compares them with those of North America. The fabric- and cord-marking, striation, check and dentate stamping techniques are described, their area of occurrence defined and chronologically tabulated. An Asiatic origin of American pottery is advanced and its diffusion traced from the Bering Sea area south to Middle and South America.

historical quarterly, Jan.–Apr. 1955. v. 19, nos. 1–2, p. 1–55.) Over 40 refs.

Survey of Russian, British, American, Spanish, etc., voyages in the North Pacific area from 1741–42 till Shelekhov's death in 1795; based on published materials which are listed (p. 7–11). Over 200 expeditions are summarized, in turn, with time, names of ship, leader and captain, route, and achievements. Their cumulative work "finally cleared up most of cartography of the Northwest Coast and Alaska." Besides exploratory expeditions voyages of traders and hunters are listed, with notes on their discoveries (e.g., Pribilof Islands) or contributions to knowledge of Alaska and the Aleutians. Alaskan natives and their trade relations with Russians are outlined in introduction. In general, the period 1741–95 was marked by withdrawal of Spaniards from competition in the North Pacific and by Russian expansion mainly through the initiative of traders in contrast with the oncoming period of monopoly and centralization of the Russian American Co. founded in 1799. ***Copy seen:*** DSI.

55499. TOZER, EDWARD TIMOTHY, 1928– . Stratigraphy of the Lewes River group (Triassic), central Laberge area, Yukon Territory. Ottawa, 1958. 28 p. illus., 2 maps, incl. 1 fold., diagr. (Canada. Geological Survey. Bulletin 43.) 25 refs.

Contains detailed description of stratigraphic sequence of the Lewes River

group in text, map, and diagrammatic columnar sections; also a list of fossils characteristic of each unit. The Lewes (Thirtymile) River group consists here of about 7,000 feet of limestone, shale, and greywacke, divided by the author, after field work 1953, into seven formations; lithology, fauna, and probable age of each are described. Formation A is probably the basal unit of the Lewes River group, underlain by andesite of Triassic or earlier age. Shales and conglomerates of the Jurassic Laberge group overlie the group. Most widely distributed fauna is an assemblage characterized by corals, a species of brachiopod, pelecypods, and rare ammonites. Comparison is made between Triassic rocks of southern Yukon and those of adjacent areas. *Map* (61°10′–61°35′ N. 135°–135°15′ W., scale 1 in. = 1 mi.) shows distribution of formations and other geologic features. ***Copy seen:*** DGS.

Basic work. Introductory part (p. 9–60) deals with the spore germination and life cycles of Uredenales; their systematics and nomenclature; tribes and genera; rust fungi as indicators of the relationship of their hosts; geographic distribution, with statistical data; parasitism on cultivated plants and methods of experimental infections. This is followed by a systematic account of over a thousand species arranged according to host families, and giving the most important synonyms and data on habitat, hosts, and geographic distribution. About 25 species are described in Latin as new. Many species recorded in northern regions of the U.S.S.R. are included. Indices of genera and species of rust fungi and of families and genera of host plants are appended. ***Copy seen:*** DLC.

nauk SSSR. Komissiia po izucheniiu chetvertichnogo perioda. Trudy, 1955. t. 12, p. 106–120, 5 maps.) 7 refs. Text in Russian. ***Title tr.:*** The origin and development of mammalian fauna of the Quaternary period in the temperate and northern zones.

Deals with the existence, distribution and changes of this fauna in the middle and northern Northern Hemisphere. Finds of large-mammal remains provide the best Quaternary paleontological evidence since they are better preserved than the remains of forest, alpine mammals or other, minor fauna. A general account is given of the species, their distribution during the Miocene, Pliocene, and early Pleistocene, and their later changes; distribution of Hipparion fauna in the Pliocene and upper Miocene and their later disappearance. The spread of new mammalian forms during the later Quaternary in northern regions of Eurasia and North America is outlined and their fate during glacial period briefly considered. Certain mammals suffered substantial impoverishment and disappeared during the transition from Pleistocene to Holocene. Survival of the musk ox, *Ovibos moschatus*, in the arctic regions is indicated. Pleistocene distribution of the mammoth (*Mammonteus primigenius* Blum.), rhinoceros (*Coelodonta antiquitatis*, Blum.), bison and elk (*Alces alces* L.) is also presented in maps.

55517. TROFIMOV, G. A. Pochemu snizilas' dobycha belki. (Okhota i okhotnich'e khoziaĭstvo, May 1958. god 4, no. 5, p. 10–12, illus.) Text in Russian. ***Title tr.:*** Why did the squirrel catch decrease?

Squirrels taken in Khanty-Mansi National District dropped from 1,432 thousand in 1938, to 173.5 thousand in 1956; the decrease is attributed to the reduction in number of hunters, inefficient hunting organization and poor equipment.

Copy seen: DLC.

55518. TROFIMOV, G. A. Puti razvitiia okhotnich'ego khoziaĭstva v Khanty-Mansiĭskom natsional'nom okruge. (Ratsionalizatsiia okhotnich'ego promysla, 1958. vyp. 7, p. 25–32.) Text in Russian. ***Title tr.:*** Development of the hunting industry in Khanty-Mansi National District.

The annual catch in this district on the Middle Ob averages approx. 300,000 squirrels, 4,000 sables, 2,000 muskrats, with a total value of over 6 million rubles; the hunters mostly belong to 39 agricultural collectives (artel'). This yield is about one-third that in 1940, an insufficient number of hunters being the main cause of the decline. Plans to double the fur output by 1960 are noted and measures are discussed for raising hunting efficiency by a shift of manpower from fisheries to hunting and trapping.

Copy seen: DLC.

55519. TROFIMOV, G. A. Zabytaia otrasl' khoziaĭstva. (Okhota i okhotnich'e khoziaĭstvo, Apr. 1957, no. 4, p. 12–13, illus.) Text in Russian. ***Title tr.:*** A neglected branch of the economy.

Discusses shortcomings of the hunting industry in Khanty-Mansi National District. Its 1955 yield of pelts was worth 20 million rubles, but only 6.8 million rubles worth was delivered by hunters, the rest came from the fur farms. The poor take is attributed to compulsory concentration of the District's inhabitants in kolkhozes, and the pressing of born hunters into the fishing industry. Lack of hunters' huts in uninhabited areas, transportation difficulties and shortage of dogs and equipment left the remote and most abundant areas unexploited. Assistance of hunters by the kolkhoz administration is urged.

Recounts discovery during 1948–1956, of diamond fields between the Yenisey River and the Lena and from the Taymyr and Anabar depressions south to the eastern Sayan Mts. The richest pipes of diamond-carrying kimberlite are in the northeast, in the Vilyuy, Olenek and Muna River basins; they are mostly oval or round in form (50 to 700 m. diameter) and are filled with fragments of limestone, traps, marls, dolomites, etc., and some magmatic minerals. Besides the kimberlite pipes, sand and gravels along the Irelyakh, Malaya Botuobuya, Vilyuy, and Markha Rivers yield diamonds. The quality of Siberian diamonds is rather low, most of them are used in the cutting industry. The average weight is 0.07 carat, the greatest 0.44. The total output from this region may compete with that of the richest diamond fields in the Belgian Congo or Ghana in Africa.

Economic developments in central and western Yakutia affecting transportation along the Lena are reviewed from 1930 to 1950. After the railroad connection with Ust'-Kut was completed (1951), the river became a major route for all northeastern U.S.S.R. Navigation on various parts varies from 70–130 days per year. In the event of sudden closing of the river due to weather, cargo is discharged on the bank and transported via the nearest highway. With the coordinated river-railroad-highway system, freight traffic has increased in volume and diversity. Transportation areas are described in detail from the economic and technical standpoints for the period 1950–1957, with attention given to specific climatic difficulties particularly in the arctic area. ***Copy seen:*** DLC.

"Problems in the improvement of permafrostology in the U.S.S.R. during the postwar period and programs for further investigation discussed at the Conference (Mar. 16–26, 1956) are outlined. Extensive data on permafrost and its physical and mechanical properties collected by several institutions were used to compile a new general map of permafrost in the U.S.S.R. (scale 1:5,000,000) and several maps for a number of regions of the Far East. New methods of thawing permafrost with solar radiation, electricity, and hot water were developed in this period, and the problem of water supply in permafrost was evaluated. Improvements were also achieved in foundation construction. The development of methods of controlling ground freezing and thawing, thorough studies of permafrostological processes and their origin in various regions, and engineering problems were noted as the chief tasks for permafrostologists during the next few years."—SIPRE.

transport," 1957. 183 p. diagrs. (1 fold.), tables. 18 refs. Text in Russian. ***Title tr.:*** Manual for the dispatcher of river fleet traffic.

The organization of river traffic including passenger, cargo and auxiliary service vessels along major and secondary waterways in the U.S.S.R. is presented in detail. Transportation on the northern rivers Ob, Yenisey, Irtysh, Lena, Amur and others is included. Organizational problems before opening and closing the navigation season are outlined (p. 143–49). ***Copy seen:*** DLC.

55539. TSYTOVICH, NIKOLAĬ ALEKSANDROVICH, *and others.* O fizicheskikh ſâvleniſâkh i protsessakh v promerzaſûshchikh, merzlykh i ottaivaſûshchikh gruntakh. (*In:* Materialy po laboratornym issledovaniſâm merzlykh gruntov, sbornik 3, 1957. p. 5–114, illus., tables, diagrs., graphs.) 109 refs. Text in Russian. *Other authors:* Z. A. Nersesova, A. P. Bozhenova, I. A. Tſûtſûnov, B. N. Dostovalov, P. A. Shumskiĭ, F. G. Bakulin, B. A. Savel'ev, V. F. Zhukov, G. A. Martynov, S. S. Vſâlov, *and* E. P. Shusherina. ***Title tr.:*** Physical effects and processes in freezing, frozen, and thawing soils.

The effects of the phase state of water on the physical and mechanical properties of frozen soils are examined on basis of the literature and recent investigations. Data collected at the Institute of Permafrostology on the liquid-water content of various soils and on the effects of temperature and pressure on the amount of unfrozen soil water, are presented. Processes accompanying ground freezing are examined in detail, and several theories on the changes in physical properties of freezing and frozen ground are discussed. Variations in supercooling related to soil composition and structure are analyzed as well as the effects of soil freezing on moisture migration, ice formation, and granulometric changes. Freezing processes in rock and the effects of ice formation on rock structure are dealt with on the basis of investigations 1920–55. The deformation of dispersed soils on thawing is discussed in detail, with emphasis on the thermal characteristics of ice melting and moisture migration in the thawing strata. Effects of temperature, chemical composition, water content, structure, surface loading, and other external factors on the properties of frozen ground are examined, and formulas for calculating their numerical values are presented.

Discusses the past and present material culture, customs and economy of one of the larger (some 2,000) Evenki (Tungus) groups, who inhabit Tuguro - Chumikanskiy and Ayano-Mayskiy districts, Khabarovskiy Kray, along the Sea of Okhotsk (approx. 54°–57° N.). Their original social organization and economy, conquest, taxation and exploitation by 18th–19th century Russian officials and merchants, economic ruin during the Civil War years, etc. are dealt with. The cultural and social advances, collectivization, transition from nomad to settled life, emancipation of women, introduction of schools and health services under the Soviet regime are described. The abortive attempt in the 1930's to introduce horticulture and animal husbandry and the present-day return by the kolkhozes to a primarily hunting, fishing and reindeer-herding economy are noted. The shortcomings of formal schooling not geared to the specific needs of the local economy are criticized.

55549. TURESSON, GÖTE WILHELM, 1892– . Contributions to the genecology of glacial relics. (Hereditas, 1927. bd. 9, p. 81–101, 5 illus., 6 tables.) 46 refs.

Evaluation is attempted of the interpretation of certain plants, like *Poa alpina*, occurring in the lowland as "glacial relics," based partly on material from Gällivare and Abisko in Swedish Lapland, and from Bodø, northern Norway. The population is split into three ecotypes: an alpine (oect. *alpinus*), a sub-alpine (oect. *subalpinus*), and a lowland (oect. *pediacus*). The concept of glacial relict is rejected. The rarity and scattered occurrence of oect. *pediacus* in Sweden is most probably due to biotype pauperization. A number of species populations were entirely deprived of their lowland ecotypes and are now represented only by arctic and alpine ecotypes. ***Copy seen:*** DLC.

55550. TURESSON, GÖTE WILHELM, 1892– . Ecotypical selection in Siberian *Dactylis glomerata* L. (Hereditas, 1929. bd. 12, häfte 3, p. 335–51, 6 illus., 7 tables.) 6 refs.

Two wild-growing Siberian ecotypes (Altay Mts.) are compared with some commercial strains viz. Danish Olsgaard and Tardus, and strains from Chernigov and the Murmansk station on Kola Peninsula, to elucidate the mechanism of ecotypical changes involving biotic factors. The two Siberian populations are found to represent well defined ecotypes which differ in important particulars from all other investigated *Dactylis* types and to show marked relationship to their Siberian habitats.

55551. TURESSON, GÖTE WILHELM, 1892– . The selective effect of climate upon the plant species. (Hereditas, 1930. bd. 14, häfte 2, p. 99–152, 25 illus.) 25 refs.

Reports on experimental study of the relation between plant and habitat, based on observations of 31 different species, of which series were collected in different climatic regions in Europe and Asia and grown under controlled conditions. *Fragaria vesca*, *Rumex aquaticus* and *Caltha palustris* from Luleå in Norrbotten, and *Spiraea ulmaria* from Abisko, Swedish Lapland, were used in the experiments. Plant height and earliness were the characters studied. Climate strongly influences the distribution of the biotypes within a species. In aestival species, pronounced earliness combines with rather moderate height in northern regions, while in the southern, lateness combines with great height. Seedling generations of the same species raised in alpine and lowland regions are genotypically lower and earlier in the former than in the latter. ***Copy seen:*** DLC.

55552. TURESSON, GÖTE WILHELM, 1892– . Studien über *Festuca ovina* L., I; normalgeschlechtliche, halb- und ganzvivipare Typen nordischer Herkunft. (Hereditas, 1926. bd. 8, häfte 1–2, p. 161–206, 14 illus., 10 tables.) 37 refs. Text in German. Summary in English. ***Title tr.:*** Studies of *Festuca ovina* L., I; sexual, semi-viviparous and viviparous types of northern origin.

Deals with types of *Festuca ovina* ssp. *eu-ovina* var. *vulgaris* collected in their natural habitat in many localities (including Swedish Lapland and Narvik, northern Norway) and cultivated at the Institute of Heredity, in Sweden, to find how climatic and edaphic factors control the composition of population in various habitats. It was shown that some morphological characteristics, as earliness, size of spikelets, etc. are affected by climatic and geographic factors, and that these characteristics are kept constant in culture. Vivipary in grasses includes phenomena of different kinds and may be "modifactorily induced" or hereditary in nature. A new conception of forms, with subdivisions: forma apomicta ("apomict"), forma amphimicta ("amphimict"), and forma amphi-apomicta ("amphi-apomict"), is introduced and discussed. A survey of apomicts and amphi-apomicts in *F. ovina*

is made, and a classification scheme presented (p. 193), where these types are named and briefly diagnosed. Further parts of this study *infra*.

Describes the techniques, distribution (from western Siberia to eastern Canada) and designs of moose-, reindeer-, and caribou-hair embroidery. Identification of hair, including texture, measurements, microscopic analysis and scale impressions are dealt with, and the use of horsehair, bird and porcupine quills chiefly for moccasin decoration by Chipewyan, Slave, Hare, and other Indians is noted. A West-Siberian, possibly Chinese-imported, origin of hair embroidery is suggested and its diffusion through eastern Siberia across the Bering culture bridge to the Aleutians and finally to eastern Canada is traced. The possibility of independent local inventions and/or adaptations is also considered. The range of reindeer and moose, and location of tribes mentioned are mapped. Hair and quill characteristics and aboriginals' embroidery tech-

niques are tabulated and photos of selected artifacts given on 16 added plates. ***Copy seen:*** DSI.

Contains a description of this ship, put into Greenland traffic in 1948. Started in 1943, she was built of wood, length 53.7 m., width 11.6 m., loading capacity 560 tons; had a diesel-electric engine, average speed of 10 knots, and carried 20 passengers. The vessel burned and sank in 1951. ***Copy seen:*** DLC.

55564. TWENHOFEL, WILLIAM STEPHENS, 1918– , *and* C. L. SAINSBURY. Fault patterns in southeastern Alaska. (Geological Society of America. Bulletin, Nov. 1958. v. 69, p. 1431–42, illus., maps incl. 1 fold.) 23 refs.

Reports study of linear features plotted from aerial photographs. They were interpreted as faults, and their patterns were analyzed with reference to the literature and to field relations. They appear to belong to a widespread and well-defined system trending northwest and to three ill-defined systems trending north, northeast and east respectively. Three large zones of parallel or nearly parallel linears, termed lineaments, are described: the Clarence Strait, Chatham Strait and Coast Range lineaments. The last two may be splits from the Denali lineament which extends for 1,600 mi. from southeastern Alaska along the Alaska Range to Bristol Bay. Most of the hot springs of southeastern Alaska are located on linears, but carbonated and sulfur springs do not seem to be. The distribution of mineral deposits in the Juneau gold belt and the Chichagof-Sitka belt may be related to certain faults, particularly those of the northwest trending system. Data supporting this thesis are presented. ***Copy seen:*** DGS.

Jan.–Feb. 1958. t. 63, no. 1, p. 71–77, text map.) 13 refs. Text in Russian. ***Title tr.:*** Some information on the vegetation of the lower Indigirka River.

The general geography of this region of northeast Yakut A.S.S.R. is outlined, and the succession of vegetation zones between 70°15′ and 70°45′ N. is indicated as tundra, swamps, shrubs, meadows, and woody vegetation. Typical plant species are listed for each. The northern limit of larch (*Larix*) reaches to 71°15′ N. In the valley of the Indigirka there are four zones north of 68° N., viz.: thin forest, forest tundra, shrubby tundra with mounds, and spotty lichen-moss tundra. ***Copy seen:*** DLC.

55568. TYRTIKOV, A. P. Temperaturnyĭ rezhim pochvy v razlichnykh rastitel'nykh soobshchestvakh v raĭone Igarki. (Pochvovedenie, June 1957. no. 6, p. 35–42, diagrs., tables.) 17 refs. Text in Russian. Summary in English. ***Title tr.:*** Thermal conditions of the soil in various plant associations in the Igarka region.

Reports results of an investigation carried out by the author (Institute of Permafrostology) in 1950. The taiga forest soil of the studied area is characterized by low temperature (1.9°–4.6° C.) during the vegetation period (June 10–Sept. 10) as compared with the temperature of ploughed soil (10.3° C.). This is due to the thick (10–20 cm.) peat horizon covered with mosses and lichens. Removal of moss cover and acceleration of mineralization of organic residues (peat horizon) are suggested as basic means for thermal amelioration of the soils in this area. ***Copy seen:*** DLC.

Doklady i soobshcheniĭa, 1956. no. 9, p. 85–92) 8 refs. Text in Russian. ***Title tr.:*** Mutual influence of languages as reflected by the interrelationship of Yakut and Evenki languages.

Discusses the theory of linguistic substrata (those elements of an original language preserved after the acceptance of a conqueror language by the autochthonous population) on the example of the Yakut dialect now used by the originally Tungus-speaking Dolgans, treated in this article as an Evenki (Tungus) tribe. This dialect, formed at the time when the Dolgans inhabited the region of the Vilyuy-Lena confluence in close proximity with the Yakuts, reflects the evolutionary stage reached by the Yakut language in the 17th century. Though phonetically and morphologically closest to Yakut, its lexical content is selective, complementing Yakut vocabulary with Evenki words. The possibility of a certain counter-influence of the Evenki language on the grammatical development of Yakut is indicated. Paper read at the Feb. 17–19, 1955, session of the Learned Council of the Institute of Linguistics (Uchenyĭ sovet In-ta ši͡azykoznaniĭa) of the Academy of Sciences U.S.S.R. devoted to the discussion of the theory of substrata. ***Copy seen:*** DLC.

ABRAMOV, L. T., *and* N. V. ZAMORINA. Fall maintenance of the airfield drainage system for winter preservation.

The final paper, by A. A. Shakhov, is: Bor'ba so snegom na aèrodromakh za granitsí (Snow control on foreign airfields), a review of the American literature, p. 73–80, illus. ***Copy seen:*** DLC.

55592. U.S.S.R. MINISTERSTVO GEOLOGII I OKHRANY NEDR SSSR. Almazy Sibiri. Moskva, Gos. nauchno-tekhnich. izd-vo lit-ry po geologii i okhrane nedr, 1957. 159 p. illus., diagrs., tables, 8 col. plates, plans, maps, incl. 1 fold. col. in pocket, 33 refs. Text in Russian. ***Title tr.:*** The diamonds of Siberia. Scientific editors: A. P. Burov *and* V. S. Sobolev.

Monographic study of the diamantiferous district in the Vilyuy River basin, approx. 300,000 sq. km. in area, and of its diamonds. Two regions of original occurrence of diamonds in kimberlite diatremes or pipes were found: in the basin of the river Malaya Botuobuya, a right tributary of the Vilyuy at approx.

63°03′ N. 113°30′ E.; and in the basin of the Daaldyn, left tributary of the Markha at approx. 66°16′ N. 113°15′ E. Two pipes were discovered in 1955 and 1956 in the first region, and 22 pipes in 1954–56 in the other. The geology, stratigraphy and tectonics of both regions are outlined and 14 pipes characterized in turn with petrographic and mineralogical data (p. 18–95). Diamonds found in the Vilyuy basin are described with details (p. 96–140); placers, mostly in Quaternary deposits and gravels along the river valleys of the Vilyuy area, are briefly noted (p. 142–46); prospecting methods are discussed with emphasis on the geophysical (magnetic); need of further exploration of the whole, highly promising, area is stressed (p. 147–56). Diamonds have been found in nine of the 24 kimberlite pipes, with the best yield in Mir (p. 7–8), Zarnitsa and Udachnaya. The largest stone found is 32.5 carats, but the diamonds generally are quite small, half less than 10 mg. and 70–90% less than 20 mg., mostly colorless, and the form is predominantly octahedral, rhombododecahedral or in transition between. Peculiarities of form, minute impurities (graphite, etc.), damage of face, etc. are discussed and illustrated; distribution data are given (p. 134–40), but none on output. Besides numerous pyropes, the best indicator in prospecting, the following minerals were found in the kimberlite pipes; ilmenite, magnetite, olivine, diopside, chromdiopside, perovskite, chromite, phlogopite, chlorite, serpentine, calciostrontianite, calcite, and several others in negligible quantities. Contributions of the Amakinskaĭa Expedition and its teams 132, 167 and 204, All-Union Trust No. 2, Scientific Research Institute of Geology of the Arctic, Eastern Geophysical Expedition and the Institute of Geology of the Academy of Sciences' East Siberian Branch are mentioned *passim*. Fold. col. geological map (1:1,500,000, in pocket) shows the diamantiferous district 61–67° N. 108–119° E.; geological text maps of the M. Botuobuya and Daaldyn regions (p. 9, 19) and geological plans of the principal pipes are given. Bibliography (33 items) includes Russian and foreign literature. The book is summarized and reviewed by C. F. Davidson in his paper: *The diamond fields of Yakutia, pub.* in *Mining Magazine*, Dec. 1957, p. 329–38. An extensive summary in German together with reproduction of the main maps, graphs, and illus. was pub. in *Zeitschrift für angewandte Geologie*, 1958, Bd. 4, Heft 10–12, p. 450–58, 497–504, 555–58. ***Copy seen:*** DLC.

55596. U.S. AIR FORCE. CAMBRIDGE RESEARCH CENTER. GEOPHYSICS RESEARCH DIRECTORATE. Arctic terrain research. Bedford, Mass., Oct. 1958. 26 p. illus. 7 maps. Refs.

Reviews activities and plans in program to study snow, ice, and natural land areas in the Arctic to determine their capabilities for supporting air activities: 1957 field work on ice strength on Angiussaq Lake, 45 miles northeast of Thule Air Base, and 1958 study of Schrader and Peters Lakes southwest of Barter Island, Alaska; tests of sea ice growth, elasticity, and strength on North Star Bugt, Mar. 1957 and Apr. 1958; Ellesmere ice shelf investigations since summer of 1954; snow field research on the Greenland Inland Ice, in cooperation with SIPRE; ice-free land research in northern Greenland, including 1958 work on the Polaris Promontory, Greenland, and near Mt. Chamberlin, Alaska; geophysical studies of the Arctic Ocean from drifting stations; study of past climates using radioactive dating methods. Statistical data, personnel lists of these studies are appended. ***Copy seen:*** DN–HO.

55597. U.S. ARMY, CORPS OF ENGINEERS. Frost penetration in multilayer soil profile. Boston, Mass., Arctic Construction and Frost Effects Laboratory, New England Division. June 1957. 49 p. 16 diagrs., 2 tables. (*Its:* Technical report no. 67.) 9 refs. Prepared by Massachusetts Institute of Technology. Dept. of Civil and Sanitary Engineering Soil Engineering Division, under contract no. DA–19–016–Eng–2743.

Evaluates the effectiveness of an adaptation of the Modified Berggren formula for predicting the depth of frost penetration in multilayer soil profiles; part of an investigation to improve techniques for predicting subsurface temperatures, particularly with reference to frost and thaw penetration below airfield pavements. Results computed by the formula are compared with "exact" solutions for the depth of freezing as determined by the hydraulic analog computer developed under the contract. Test results indicate that the frost depth formula underpredicts by about 3%, an insignificant error. ***Copy seen:*** DN–HO.

55598. U.S. ARMY. CORPS OF ENGINEERS. Greenland ice cap research program, studies completed in 1954. Vicksburg, Miss., Feb. 1957. 2 v. illus., maps, diagrs., tables.

Research and development reports prepared by U.S. Army Engineer Arctic Construction and Frost Effects Laboratory, Research and Development Laboratories, SIPRE, and Waterways Experiment Station. Each report is described in this Bibliography under its author's name, viz.:

Vol. 1

FRYE, F. J. Report on Greenland Operation, 1954.

55601. U.S. ARMY. CORPS OF ENGINEERS. POLAR RESEARCH AND DEVELOPMENT CENTER. Design and construction of an undersnow camp on the Greenland ice cap. Fort Belvoir, Va., Nov. 1958. vi, 13 p. 13 diagrs. (*Its:* Report no. 1, issued in U.S. Army. Corps of Engineers. Greenland Ice Cap Research Program. Studies conducted in 1955–56. June 1959, v. 3.)

Describes project carried out May 13–Aug. 24, 1957, following design and planning done in winter 1956–57. Excavation, covering, completion of installations, development of operational techniques and methods are described, and illustrated with diagrams. Electrical, water supply, waste disposal, heating and ventilating systems are included. Camp Fist Clench (Site 2), built at reasonable cost with troop materials, accommodates 100 men plus 50 additional men in above-snow Jamesway huts.

Copy seen: CaMAI.

55602. U.S. ARMY. CORPS OF ENGINEERS. *St. Paul District.* Comprehensive report, investigation of military construction in arctic and subarctic regions, 1945–1948; appendix 1, airfield site studies at Northway Airfield, Alaska. St. Paul, Minn., prepared for Office of the Chief of Engineers, Airfields Branch,

Engineering Division, Military Construction. June 1950. ii, 31 p. incl. 25 plates (part fold.), illus., diagrs., tables, maps. Appendix to No. 48547.

Contains summary of data for soil characteristics, ground temperatures, ground water, foundation design, and other factors which have affected the design and construction at Northway Airfield (62°58′ N. 141°58′ W.). Particular reference is made to permafrost and its associated problems. Included are subsurface investigations (30–50 ft.) to determine the depth of permafrost, and seasonal water-table fluctuations. Results of runway tests indicate that seasonal frost and permafrost join in either late Nov. or early Dec. Building tests were made on a hangar, motor pool, powerhouse, garage, fire station, boiler house, pump houses, water tank, and a utilidor system. ***Copy seen:*** AMAU.

55603. U.S. ARMY. CORPS OF ENGINEERS. SNOW ICE AND PERMAFROST RESEARCH ESTABLISHMENT. Preliminary reports 1957 Greenland field research. Wilmette, Ill., May 15, 1958. 32 p., 4 diagrs.

"The objectives and accomplishments of 19 SIPRE research projects in the Thule and Narsarssuak areas are described; preliminary results are summarized, and recommendations for future studies are made. The projects included: crevasse location and mapping; ramp, snow-structure, patterned-ground, ice-tunnel, whiteout, snowdrift, ice-cliff, and icecap-access studies; the development of icecap-drilling, core-sampling, and aerial-photographic research techniques; drill-hole and icecap site measurements; pile and explosives testing; and the determination of the physical properties of ice and frozen till for applied geophysics purposes."—SIPRE.

55606. U.S. ARMY. ENGINEER ARCTIC TASK FORCE. Greenland research and development program 1957; after operations report. Fort Belvoir, Va. Nov. 1, 1957. 10 p. text maps, charts.

Outlines general accomplishments of this, fourth, program; 27 projects in engineering in snow, ice, and permafrost regions, in photography and testing equipment, are described. Field work was carried out Apr. 15–Sept. 10, 1957, with camps at Narsarssuak, Thule Air Base, Kanak (New Thule), Camp Red Rock, Blue Ice Valley, Whitehorse (mile 23) and Mile 30 on the trail to Site II (Fist Clench). Scope of the program, its organization, mission, and chronology, are noted; project leaders, objectives, and achievements are indicated; work of supporting operations is summarized, with emphasis on safety, sanitation, supply economy, and detailed project support. For the 1958 report, see No. 55608.

55607. U.S. ARMY. ENGINEER RESEARCH AND DEVELOPMENT LABORATORIES. Summary of arctic tests, winter 1956–1957, conducted by Corps of Engineers Field Test Team. (Arctic), Fort Churchill, Manitoba, Canada. Fort Belvoir, Va., Mar. 24, 1958. 40 p., illus., table. (*Its:* Technical report 1512–TR.)

Reviews about eleven tests conducted Dec. 1, 1956–Mar. 31, 1957; omitting measurement data, conclusions, recommendations. Objective, test item, procedure, results, and the effect of environmental exposure are noted; illus. are included of some of the items. Appended is tabulated technical information for equipment tested which included three types of generators and a modified M–40 slave kit, four types of engines, four types of heaters, insect screens, and explosives fired in frozen ground; temperature, wind, and windchill conditions for the test period are graphically presented.

Outlines general accomplishments of this program, the fifth and most extensive since its inception in 1954. Its 22 projects in engineering in snow, ice, and permafrost regions, medicine and testing equipment are described. Field work was carried out May 10–Sept. 14, 1958, with camps at Narsarssuak, Thule Air Base, New Thule (Kanak), TUTO, Blue Ice Valley, and Site II (Fist Clench). Project leaders, objectives, and achievements are noted; work of supporting operations, with emphasis on safety, supply economy, and preparation for the 1959 program, is briefly treated.

55610. U.S. BUREAU OF AERONAUTICS. (Navy Dept.). The arctic weather station. Norfolk, Va., Sept. 1957. 66 p. illus., diagrs., text map, tables (*Its:* Project AROWA, Technical report.)

Contains information on establishing and maintaining a weather station in the Arctic, and description of 31 stations: 22 in Canada, nine in Alaska; prepared by the Naval Research Laboratory and based upon a three-year study conducted at the Laboratory and in Alaska. Information includes environmental considerations; selection, inspection, winterizing, and installation of equipment; maintenance; operation; ice reporting. Practical advice on living in the Arctic is offered, with remarks on effects of wind chill, permafrost, etc.

U.S. BUREAU OF INDIAN AFFAIRS, *see* U.S. Congress. Alaska native loan program . . . *1958.* No. 55619.

55611. U.S. BUREAU OF LAND MANAGEMENT. Information relative to the use and disposal of public lands and resources in Alaska. Washington, U.S. Govt. Print. Off., 1957. i, 42 p., map, tables. (*Its:* Information bulletin no. 2, rev.)

Presents concise general information on area, climate, topography, transportation, living conditions, public education and health service, industries, etc. Major settlement areas are described in turn with information on local economy and prospects, also, for approx. 45, tabulated climatological data. Regulations are outlined regarding land claims for settlement, mining, commercial, timber or

other uses; counsel is offered on site selection; and public offices listed for further information. ***Copy seen:*** DI.

55612. U.S. BUREAU OF RECLAMATION. Eklutna dam, power plant and tunnel. Technical record of design and construction. Denver, Colo., Mar. 1958. 254 p. illus., tables, 20 refs.

Detailed account of planning, design and construction of this project carried on 1951–55, to furnish Anchorage (35 mi. southwest) with power from a 30,000 kw. hydroelectric development. Pt. 1 contains discussion of general planning and historical data, summary of costs, description of regional and construction geology. No minerals of economic importance were discovered. Pt. 2 deals with design: the existing dam, built in 1941 at the outlet of Eklutna Lake into Eklutna River, is an earth and rockfill structure with wood and steel piling core walls, and is riprapped on the upstream face. Additions and changes to the dam, and design for construction of the tunnel, and power plant are described, illustrated by photos and drawings. Administration, operations and equipment used in construction of tunnel and power plant are described as pt. 3. Weather and labor factors caused only minor delays. Costs summary, government organization chart, project specifications, etc. are appended. ***Copy seen:*** DGS.

55613. U.S. BUREAU OF RECLAMATION. Soil engineering in frost areas, a summary of the summer session given at Massachusetts Institute of Technology, June 11–21, 1957. Denver, Colo., Oct. 3, 1957. 23 p. 12 p. maps, diagrs., graphs, table. (*Its:* Earth Laboratory report, no. EM–510) 10 refs.

Contains notes of H. J. Gibbs on ten lectures by various authorities dealing with present practices and theories of design and construction in frost areas. Areas, frost penetration, growing of ice lenses, frost susceptible soil (cold room studies), design criteria for pavement, highway engineering practices, etc., are treated in turn. Requirements for airfield and highway pavements bearing wheel loads are stressed.

55614. U.S. CENTRAL INTELLIGENCE AGENCY. Activities in the Arctic and Antarctic. Washington, D.C., Sept. 30, 1958. 9 p. (*Its:* Foreign documents Division, no. 5.)

Summarizes (from foreign sources, mainly newspapers) recent Russian and Scandinavian activities (p. 1–7); Soviet aerial ice reconnaissance; meteorological observations from specially equipped aircraft, achievements in polar aviation and navigation on the Northern Sea Route, etc. Establishment of a Norwegian seismographic station in Spitsbergen is noted. A Swedish expedition to Spitsbergen is to winter at Murchison Bay and continue work in cosmic physics started by the 1957 expedition. A Norwegian-Finnish archeological expedition has returned from Spitsbergen, its work to be continued next summer by a Norwegian-Swedish party. A conference on medical problems of the Arctic opened in Helsinki on Sept. 4, and continued the following day in Oulu, where it is hoped to establish a research institute for arctic medicine. ***Copy seen:*** DGS.

55615. U.S. COAST AND GEODETIC SURVEY. The Coast and Geodetic Survey, 1807–1957; 150 years of history, by A. Joseph Wraight and Elliott B. Roberts. Washington, 1957. 89 p. illus., port.

Chronicle of the Survey's field activities, with information on leading personnel, organization and technical procedures. Work in Alaska and the Aleutian Islands started with the southeast coast in 1807; the systematic survey was begun in 1882 and intensified in 1898. Work on the west and north coasts during and after World War II, also mapping of the northern interior by triangulation and trilateration are dealt with. Magnetic observatories were established at College in 1948 and Pt. Barrow in 1949. Publication of Alaskan charts and coast pilots is discussed among others. The Survey's participation in the Labrador Eclipse (1860) and Polar Year (1881–1884) expeditions and in IGY studies are mentioned among others. Its application and development of new equipment are dealt with; Shoran and E P I (electronic position indicator) in 1957 controlled all hydrographic surveys except those in immediate shore areas. ***Copy seen:*** DLC.

55616. U.S. COAST AND GEODETIC SURVEY. Tide tables east coast North and South America, including Greenland, 1959. Washington, D.C., U.S. Govt. Print. Off., Dec. 1957. 271 p. index map, diagr., tables.

Contains daily tide predictions; list of

reference stations (none arctic); tidal differences and other constants, including Canadian Arctic Islands waters, Greenland Sea-Denmark Strait, Baffin Bay-Davis Strait, Hudson Bay and Strait, Labrador Sea; height of tide at any time; local mean time of sunrise and sunset (to 76° N.); reduction of local mean time to standard time; moonrise and moonset; astronomical data, 1959.

Copy seen: DN–HO.

55617. U.S. COAST AND GEODETIC SURVEY. Tide tables west coast North and South America, including the Hawaiian Islands, 1958. Washington, D.C., U.S. Govt. Print. Off., 1957. 222 p. diagr., tables. Annual publication, new format with this issue.

Contains seven tables: daily tide predictions; tidal differences and other constants; height of tide at any time; local mean time of sunrise and sunset; reduction of local mean time to standard time; moonrise and moonset; and astronomical data. Reference stations include: Anchorage, Cordova, Dutch Harbor, Juneau, Ketchikan, Kodiak, Massacre Bay, Nushagak Bay, Seldovia, Sitka, St. Michael, Sweeper Cove in Alaska. Tidal differences are tabulated for Gulf of Alaska, Aleutian waters, Bering Sea, and Beaufort Sea. Local mean time of sunrise and sunset is tabulated to 76° N. ***Copy seen:*** DN–HO.

55618. U.S. COAST GUARD. International Ice Patrol. Washington, U.S. Coast Guard, Public Information Division, 1956. 20 p. illus.

Reviews floating ice dangers in the North Atlantic and role of I. I. P.: its air and surface operations, communications system, etc., founding and organization. Summary information is given with illus., diagrams, etc. on ocean currents, ice, and icebergs in the I. I. P. area. ***Copy seen:*** DLC.

55619. U.S. CONGRESS. HOUSE. COMMITTEE ON GOVERNMENT OPERATIONS. Alaska native loan program. Twenty-fifth report. Washington, U.S. Govt. Print. Off., May 28, 1958. v, 40 p. (85th Cong., 2d sess. House report no. 1821.)

Reports on the Public Works and Resources Subcommittee investigation of this program's administration by the Bureau of Indian Affairs: a preliminary statement of the problem, the Subcommittee's conclusions and recommendations, narrative statement of the findings, minority report refuting allegations and defending the Bureau's procedures; and four appendixes of evidence presented in the investigations. The report deals mainly with four communities in Southeast Alaska where the salmon canneries, financed by the loan program, have been not completely successful, due primarily to decreasing salmon runs but also to other factors which are discussed. Recommendations include: continued conservation research and management to improve fishery productiveness; loans for more large boats to be used in outside waters when fish runs are poor inside; vocational training of natives for top financial and administrative work in the canneries. New industries and enterprises should be fostered to make the communities less dependent on salmon.

55620. U.S. CONGRESS. HOUSE. COMMITTEE ON INTERSTATE AND FOREIGN COMMERCE. The International Geophysical Year: the Arctic, Antarctica. Washington, D.C., U.S. Govt. Print. Off., Feb. 17, 1958. 182 p. illus., maps, tables. (U.S. 85th Congress, 2d sess., House report no. 1348.)

Reports on observations by a House Subcommittee of the U.S. International Geophysical Year program. Arctic and Antarctic programs differ. The Arctic, a major ocean basin surrounded by continents containing most of the world's population, requires geophysical information applicable to problems involving transportation, communication, natural resources and economics. Studies at drifting station A (approx. 80° N. 159° W.) were on aurora, geomagnetism, arctic sea ice heat budget, arctic sea ice physics, meteorology, oceanography, and human factors. At Fletcher's Ice Island (station B, approx. 82°50′ N. 99° W.) they were on meteorology, oceanography, gravimetric measurements, ionospheric physics, aurora investigations and thermal budget. Current status and importance of "great circle" routes are considered; operation of a route over the North Pole by an American carrier is recommended for renewed study. A summary of IGY activities and U.S. findings through Nov. 1957, by Dr. H. Odishaw, is appended, also pub. in the Jan. 17, 1958 issue of *Science*.

55622. U.S. DEPT. OF STATE. U.S., Canada, Japan, and U.S.S.R. sign fur seal convention. (*Its:* Bulletin, Mar. 4, 1957. v. 36, no. 923, p. 376–80.)

Notes signing in Washington, Feb. 9, 1957 and gives text of the Interim Convention for the Conservation of North Pacific Fur Seal Herds. Provisions include the establishment of a North Pacific Seal Commission, a six-yr. cooperative research program, prohibition of pelagic sealing except for research, controlled land killing of seals by the United States and U.S.S.R. with Canada and Japan receiving from each annually 15% shares of skins. More permanent arrangements for conserving the herds are to be considered toward the close of the six-yr. period. ***Copy seen:*** DLC.

55623. U.S. DEPT. OF THE INTERIOR. OFFICE OF TERRITORIES. Mid-century Alaska. Washington, D.C., U.S. Govt. Print. Off., 1957. 170 p. illus., maps, tables. New ed. of No. 26946.

Information handbook on present-day Alaska and its potencialities. Surface features, climate, population, history and government, cities and towns, housing, education, employment opportunities, health and health services, industries and resources, agriculture, wildlife, land acquisition and settlement, maps, recreation, transportation, and traveling conditions are treated in turn. ***Copy seen:*** DGS.

55624. U.S. FISH AND WILDLIFE SERVICE. Administration of Alaska Commercial Fisheries. Progress report and recommendations for 1957. Juneau, Alaska, 1956. 34 p. illus., maps, tables.

Contains description of conditions and trends in Alaskan salmon fisheries generally and in the fishing areas; also in herring fisheries, abundance, stock, etc. 1956 statistics of salmon pack, reduced herring, number of fishermen, boats, gear, are given. Tentative proposals are presented (p. 24–34) of 1957 regulatory amendments for the different areas, including areas of fresh-water fisheries.

55625. U.S. HYDROGRAPHIC OFFICE. Convoying in ice. Washington, D.C., 1957. Sheet 30 x 45 in., text and illus. in verso of H.O. pilot chart no. 1400, Aug. 1957.

Mainly based on Russian accounts of ice convoy operations; the organization of convoys, types, distance between ships, course and speed, etc., are outlined, and procedures of conducting, towing, and breaking out of ships are described. A table of whistle signals is included. The pilot chart of the Greenland and Barents Seas on the reverse side includes information on ice limits, currents, sea and air temperatures, prevailing wind and weather, precipitation, visibility, and sky.

55626. U.S. HYDROGRAPHIC OFFICE. An evaluation of the "Morskoi Atlas", with translations from volumes I and II. Washington, D.C., Mar. 1958. 441 p., table. (*Its:* Technical report, TR–38.) Refs.

Compares the analysis by Russian environmentalists with others'. Includes a detailed evaluation of volume 2, on oceanography and marine climate, with translations of most of its textual material, and of other important portions of both volumes. The report was prepared by H. W. Dubach and M. A. Slessers. These and a third volume are described as No. 48515 and 55595.

Copy seen: DN–HO.

55627. U.S. HYDROGRAPHIC OFFICE. Oceanographic atlas of the polar seas, part II, Arctic. Washington, D.C., 1958. 143 p., 12½ x 16 in., 132 illus. (*Its:* H.O. Pub. 705.) 124 refs.

Basic reference work, with pt. I, pub. 1957, on the Antarctic, completing the first atlas in a series planned to cover all ocean areas. Review of United States' arctic exploration is followed by charts, mostly completed in early 1957, presenting information by months or seasons: tides and currents, physical properties, ice, wind sea and swell, marine geology, marine biology, distribution of oceanographic and bathythermograph observations, are treated in turn. Reliability

diagrams for some elements are included and principal sources of data are listed. Base chart for most analyses is a polar (equidistant azimuthal) projection which extends at least to 65° N.; a few large scale Mercator charts provide greater detail. Reviewed by H. W. Dubach, in *Arctic*, June 1959. v. 12, no. 2, p. 115–16.
Copy seen: DN–HO.

55628. U.S. HYDROGRAPHIC OFFICE. Oceanographic survey results, Project 572, July–September 1955. Washington, D.C., Apr. 1957. 169 p., photostat, fold. maps, tables. (*Its:* H.O. Misc. no. 16366.)

Contains summary of a hydrographic-oceanographic survey, conducted, summer 1955, by USS *Requisite*, in the Western Arctic. Ship's main track, location of oceanographic, current, and bottom sampling stations between Pt. Barrow in Alaska and Shepherd Bay, Northwest Territories, and special hydrographic survey areas, are shown on maps; tables summarize observations at 99 oceanographic stations, 46 Phleger cores and 85 grab samples, and Ekman current meter observations at 19 locations. Explanation of data is provided in the appendix. Depths in survey areas were shallow; observations were mostly made at 20 meters or less.

55630. U.S. HYDROGRAPHIC OFFICE. Sailing directions for Baffin Bay and Davis Strait, 2d. ed. 1951; change no. 2–3. Washington, D.C., 1957–1958. loose-leaf. (*Its:* H.O. Pub. no. 76, change no. 2–3.)

Contain additions and corrections to No. 37924, 43023, through Mar. 22, 1958.
Copy seen: DN–HO.

55631. U.S. HYDROGRAPHIC OFFICE. Sailing directions for northern Canada, 2nd ed. 1951; change no. 2–3. Washington, D.C., 1957–1958. loose-leaf. (*Its:* H.O. Pub. no. 77, change no. 2–3.)
Contain additions and corrections to No. 26956, No. 43025, through Apr. 2, 1958.
Copy seen: DN–HO.

55632. U.S. HYDROGRAPHIC OFFICE. Sailing directions for the northwest and north coasts of Norway, fourth edition, 1952; change no. 3, 1/19/57, and no. 4, 4/26/58. Washington, D.C., U.S. Govt. Print. Off., 1957–1958. loose-leaf. (*Its:* H.O. Pub. no. 136, change no. 3–4.)

Contain extensive corrections and additions to No. 37931. Includes *Notice to mariners* no. 17, 1958.
Copy seen: DN–HO.

55633. U.S. HYDROGRAPHIC OFFICE. World port index; locations and general descriptions of maritime ports and shipping places, with references to appropriate sailing directions and charts. Washington, D.C., U.S. Govt. Print. Off., Second ed., 1957. xxv, 201 p., 21 charts. (*Its:* H.O. Pub. 950.) Refs.

Includes data through 1957, with contents and format similar to the first edition (No. 37936) now superseded.
Copy seen: DN–HO.

55634. U.S. INTERSTATE COMMERCE COMMISSION. Alaska transportation problems. Letter to Warren G. Magnuson, chairman, Committee on Interstate and Foreign Commerce, outlining a plan for the economic and safety regulation of transportation to, from, and within Alaska, and analyzing the proposed implementing legislation, S. 1448. Washington, D.C., U.S. Govt. Print. Off., 1957. ii, 10 p. table. (Committee print, 85th Cong., 1st sess. Senate.)

Suggests integrating transportation within Alaska, and the Alaskan system with that of the other states, as far as practicable; the intra-Alaskan transportation to be controlled by Alaskans. Proposed amendments (described and explained) would, generally, extend the Interstate Commerce Act to Alaskan transportation. ***Copy seen:*** DLC.

55635. U.S. LIBRARY OF CONGRESS. SCIENCE AND TECHNOLOGY DIVISION. Bibliography on snow, ice and

permafrost, with abstracts. Washington, D.C., 1957, 1958. 2 v.: 213, 236 p. (SIPRE report 12, v. 11–12, Jan. 1957–Jan. 1958.)

Each vol. contains 1,000 abstracts of papers on snow, ice, perennially frozen ground and related engineering problems. Scope is similar to v. 1–10 (cf. No. 48618), but with v. 11, the publication appears annually and is directed by Thomas E. Hughes.

Copy seen: DLC.

55636. U.S. LIBRARY OF CONGRESS. TECHNICAL INFORMATION DIVISION. The polar bibliography, v. 2. Produced for Dept. of Defense. Washington, D.C., Mar. 15, 1957. xii, 235 p. In sequence to No. 48619.

Lists, with abstracts, 2,000 reports, unclassified (for security purposes) and in the same fields as v. 1. ***Copy seen:*** DLC.

55637. U.S. NATIONAL BUREAU OF STANDARDS. Mechanical properties of metals at low temperatures; Proceedings of the NBS Semicentennial Symposium, May 14–15, 1951. Washington, D.C., U.S. Govt. Print. Off., May 7, 1952. iv, 206 p. illus., tables, graphs, diagrs. (*Its:* Circular, 520.)

The nine papers presented are listed in this Bibliography under their authors' names, viz:

ALLEN, N. P. Recent European work on the mechanical properties of metals at low temperatures.

AUSTIN, J. B. Manufacture of steels for low-temperature service.

CRAFTS, W., *and* C. M. OFFENHAUER. Development and application of chromium-copper-nickel steel for low-temperature service.

GEIL, G. W., *and* N. L. CARWILE. Tensile properties of copper, nickel, and some copper-nickel alloys at low temperatures.

JOHNSON, J. B., *and* D. A. SHINN. Application of metals in aircraft at low temperatures.

KRIVOBOK, V. N. Properties of austenitic stainless steels at low temperatures.

MacGREGOR, C. W., *and* N. GROSSMAN. Dimensional effects in fracture.

55642. U.S. NAVY ELECTRONICS LABORATORY. Current, temperature, tide, and ice growth measurements, eastern Bering Strait-Cape Prince of Wales, 1953–55. San Diego, Cal., Oct. 18, 1956. 25 p. illus., text maps, diagrs., tables. (*Its:* Research report 739.) 13 refs.

Data obtained 1953 through 1955, at Cape Prince of Wales Field Station, Wales, Alaska, are evaluated by G. L. Bloom, part of a program of physical-oceanographic research concerning prediction of ice coverage in the Bering-Chukchi-Beaufort Sea area. Average mass water transport through eastern Bering Strait fluctuates in volume and direction throughout the year. Bottom sea water temperatures in eastern Bering Strait are highest in late August, and are related to north-south shifts in wind direction and current. Growth of fast ice at Wales is related to the total number of degree days below 29° F. Ice usually forms in late Oct.–early Nov. and break-up is usually completed by mid-June. Tides are usually semi-diurnal, ranges in summer average less than 12 inches.

55643. U.S. NAVY. MILITARY SEA TRANSPORTATION SERVICE. Atlantic-Arctic operations, CTF6 post operation report 1957. Brooklyn, N.Y. Dec. 20, 1957. 1 v., pagings various, illus., diagrs.

Contains description of MSTS resupply of established activities and the sealift of materials for the construction and resupply of the DEW Line and Gap Filler Pinetree projects. Area of operations extended from the east coast of Greenland to 98° W., and nearly to 82° N., and included the coasts of Labrador, Baffin Island, Foxe Basin, Greenland, Ellesmere Island, and through Bellot Strait. Despite severe ice conditions on the Labrador coast and bad weather, 270,179 tons of dry cargo and nearly 3,000,000 barrels of bulk petroleum were transported. The various operations are reported in turn: summary is followed by the commanders' reports, which include ice reconnaissance, navigation, ice operations, helicopter operations, tides, hydrography, health, etc. HMCS *Labrador* provided information on a possible safe route from the central Canadian Arctic Islands eastward through Bellot Strait.

Copy seen: DN–HO.

55644. U.S. NAVY. MILITARY SEA TRANSPORTATION SERVICE. MSTS Arctic operations 1957. Post operation report. Washington, D.C., Mar. 25, 1958. Pagings various, illus., fold. map, tables.

Commander's report on 1957 sea transport of personnel and materials to northern (including DEW Line) posts. Weather and ice conditions were the most severe in many years, 37 ships reporting ice damage; a practical deep-water Northwest Passage via Bellot Strait was proved. In nine parts, the report covers: advance planning and preparation, operations, intelligence, administration and personnel, communications, operational visits, public information, photographs, and fiscal matters. Five tables provide statistical information. ***Copy seen:*** DN–HO.

55645. U.S. NAVY. MILITARY SEA TRANSPORTATION SERVICE. MSTS polar logistics. (*Its:* MSTS magazine, Sept. 1957. v. 7, no. 9, p. 3, illus.)

The MSTS has sealifted more than 2.5 million measurement tons of cargo and over 12 million barrels of fuel and petroleum products to the far North since 1950. Arctic operations during 1957 involved over 100 ships and 12,000 military and civilian personnel. The hazardous nature of the operation is shown by a photograph of a convoy working through ice floes.

Copy seen: DLC.

55646. U.S. NAVY. MILITARY SEA TRANSPORTATION SERVICE. MSTS seeks a Northwest Passage. (*Its:* MSTS magazine, June 1957. v. 7, no. 6, p. 8–11, 23, map, photos.)

Discusses attempt to be made during summer 1957 to establish a usable Pacific to Atlantic route for regular cargo vessels. A joint U.S.-Canadian force of ice-breakers and buoy tenders under

Vice-Admiral John M. Will (resupply vessels in Shepherd Bay area) will attempt to pass through Bellot Strait, 12 miles in length between Boothia Peninsula and King William Island. Success of the route depends on depth in the narrows of the Strait. If navigable, it would provide an alternate, eastward route for supply vessels in case of ice blockage around Point Barrow. A brief historical survey of searches for the Northwest Passage is included. ***Copy seen:*** DLC.

55647. U.S. NAVY. MILITARY SEA TRANSPORTATION SERVICE. MSTS shipbuilding program. (*Its:* MSTS magazine, June 1957. v. 7, no. 6, p. 3–7, 22–23, illus., diagrs.)

Four specially designed classes of ships (three of them for ice navigation) approved by Congress in June 1954 for this Service are described and illus. The ships currently under construction include an ice-strengthened cargo ship (dock), two ice-strengthened small tankers, and three ice-strengthened small cargo ships. The cargo ship (dock) is for bulk transportation involving the movement of lighterage and landing craft through ice-filled water. The prototype which resembles the Navy's landing ship dock is over 465 ft. long with a loaded displacement of 9,960 tons. The ship features a reinforced hull, ice-breaker bow, amidships ice belt, and fibrous glass hull insulation. The two tankers answer a special need for delivery of bulk petroleum to the Arctic. They are 302 ft. long and sufficiently strengthened to operate virtually anywhere ice-breakers can go. The small cargo ships are 266 ft. long and feature all-welded steel construction and ice-breaker-type bow.

Copy seen: DLC.

55648. U.S. NAVY. MILITARY SEA TRANSPORTATION SERVICE. St. John's has arctic ops prelude. (*Its:* MSTS magazine, June 1957. v. 7, no. 6, p. 20–21, photos, sketch map.)

The unusually heavy ice conditions around Newfoundland during the spring of 1957 and operations of U.S. Military Sea Transportation Service relief ships are described. The ice moved south into the Gulf of St. Lawrence much sooner than usual; tankers and cargo vessels penetrated into ice-locked harbors under ice-breaker escort. ***Copy seen:*** DLC.

55649. U.S. NAVY. MILITARY SEA TRANSPORTATION SERVICE. Six ships will remain in Arctic. (*Its:* MSTS magazine, Sept. 1957. v. 7, no. 9, p. 18, illus.)

Six MSTS ships used in the 1957 DEW Line resupply operations will be leased to the Northern Transportation Co. of Canada and winter (1957–58) at Port Brabant, N.W.T. This company will resupply western sector DEW Line sites served 1955–57 by MSTS.

Copy seen: DLC.

55650. U.S. NAVY. MILITARY SEA TRANSPORTATION SERVICE. Skill and experience versus elements and terrain. (*Its:* MSTS magazine, Sept. 1957. v. 7, no. 9, p. 5–13, illus., map.)

Logistic support provided for the DEW Line by MSTS arctic operations during the three seasons of 1955–57 is reviewed in general and assignments for the 1957 project are listed. The latter includes: resupply of sites along the DEW Line from the northwest tip of Alaska to the east coast of Baffin Island; resupply of Air Force bases in the Greenland, Baffin Island, Labrador, and Newfoundland areas; delivery of equipment and supplies to electronic stations in the Labrador and Newfoundland areas; resupply of the Pribilof Islands sealing stations; and hydrographic survey and establishment of navigational aids for the water areas across the northern periphery. Some 100 ships are to move 242,000 measurement tons of cargo and equipment and three million barrels of petroleum products during the 1957 operations. Scientific observations are to be made from some of the vessels in support of the IGY. The ice pack is the most serious hazard affecting operations. Inadequate charts, too much daylight to permit celestial fixes, and low sun add to navigational difficulties. Schematic map shows the areas of MSTS operations, 1950–57 and the approximate locations of the DEW, Mid-Canada, and Pine Tree Lines.

Copy seen: DLC.

55651. U.S. NAVY. MILITARY SEA TRANSPORTATION SERVICE. ATLANTIC AREA. Post operation report of MSTS arctic operations (east) 1958. Brooklyn, N.Y. Dec. 22, 1958. 1 v., pagings various, illus., text map, diagrs., tables.

Report of operations, May 1–Dec. 2, 1958, in resupply of U.S. Air Force installations in Greenland, on the east coast of Baffin Island and Labrador; transportation of personnel, equipment and ma-

terials for the construction of the Greenland extension of the DEW Line; and resupply of other stations. Area of operations extended from Labrador, Baffin and Ellesmere Islands on the west to the east coast of Greenland, and northward to Lake Hazen and Polaris Promontory. Resupply of DEW Line sites in the Foxe Basin area was carried out by Canadian Dept. of Transport. Included is Project Polynya Report, describing extension of docking operations at Thule until late October. Release of compressed air under water cleared ice from DeLong pier. Difficulties in the Gap-Pine resupply operation, adverse ice conditions between Kap York and Upernavik, ship damage, gains in ice forecasting, etc., are noted.

55657. U.S. WEATHER BUREAU. Climatological data, Alaska. Asheville, N.C., National Weather Records Center, 1957. v. 43, no. 1–12 and summary, each no. approx. 15–20 p.: text, tables, maps. File from 1915, previously listed as No. 26975.

Monthly and annual summary of data collected at approx. 150 stations; also records of daily precipitation, daily maximum and minimum temperatures, daily snowfall and snow on the ground, supplemental (airport) data. Reference notes explain measurements and adjustments made. Monthly and seasonal snowfall and heating degree days for the preceding 12 months appear in the June issue (no. 6). Maps show distribution of monthly precipitation, and of average monthly temperature.

Copy seen: DWB.

55658. U.S. WEATHER BUREAU. Monthly climatic data for the world. v. 9–11, 1956–1958. Asheville, N.C., 1956–1958. In sequence to No. 46847. Sponsored by World Meteorological Organization in cooperation with U.S. Weather Bureau.

Monthly issues, each 24–28 p. present tabulated surface data on pressure, temperature, relative humidity, precipitation; upper air data on temperature, dew point, wind direction and speed for seven pressure surfaces up to 100 mb. Data are reported from selected stations, listed by continents and countries, and noting latitude, longitude and elevation. Several arctic stations are included: 11 from Alaska, 21 Canada, 7 Greenland, 11 U.S.S.R (incomplete), etc.

File seen: DWB.

55659. U.S. WEATHER BUREAU. Severe ice in North Atlantic. (*Its:* Mariners weather log, May 1957. v. 1, no. 3, p. 48.)

Reports of mariners indicate unusually severe ice in the Newfoundland area in early 1957. The sinking of a 134-ft. vessel after striking an iceberg on Feb. 4 about 35 mi. east of Cape Breton Island is reportedly the first vessel sunk by iceberg collison since the *Titanic* (in 1912). By mid-March, the ice pattern was two months ahead of schedule.

(Dal'stroĭ, Gostrest [Trudy] Materialy po izucheniîu Kolymsko-Indigirskogo kraîa, seriîa 2, Geologiîa i geomorfologiîa, vyp. 7.) 9 refs. Text in Russian. Summary in English. ***Title tr.:*** The Mesozoic of the upper Kolyma region.

Contains description of Mesozoic sedimentary rocks in the Kolyma basin and adjacent areas, based on material collected by geologists of the Upper Kolyma Expedition, 1933–35, sponsored by State Trust Dal'stroĭ. The Mesozoic sediments were found chiefly in the western part of the region studied, on tributaries of the Kolyma (Ozhogina, Zyryanka, etc.) and the Indigirka (Moma, Nera, etc.); these rocks had a role in formation of the folded region of the Cherskogo Range. Occurrence of Triassic, Jurassic, and Cretaceous rocks is outlined, and faunal fossils found in these strata are noted. Marine transgression and regression in the area during the Mesozoic era are discussed (p. 4 and 26–29).

A comprehensive study of the littoral, sublittoral and pseudoabyssal of this strait between the two islands of Novaya Zemlya. It is introduced (p. 5–40) with an outline of the scope of the investigation, earlier studies, topography of the area, nature of bottom, hydrological conditions of the strait, and meteorological observations. The biocoenoses of the three zones are described (p. 41–63), the sublittoral showing the quantitatively and qualitatively richest fauna. The seaweeds of the area, distribution of the benthonic forms and general character of the fauna are treated in turn. Tables are presented indicating, in detail, the distribution of the main animal groups over the area, by a list of dredging and trawling stations and the forms found at them. The study is based on field work conducted during 1923–1929.

A new method for designing foundations for houses and industrial constructions in the permafrost region, which is given in the "Standards and Technical Regulations" (NiTU–118–54), is analyzed. Values of thawing depth and rate, sagging rate, tilting, and relative deflection for different types of constructions are given. Conditions for maintaining stability of complex structures are discussed with consideration given to rigidity of construction for certain values of compressibility of ground and foundation, computed values of depths and rates of thawing, certain measures for regulating the rate of thawing and uneven sagging. Permissible deformation is related to rigidity of construction and compressibility of the ground, both of which are dependent upon heat insulating and ventilating provisions. Experience shows that non-rigid and very rigid constructions are subjected to less deformation than those with medium or semi-rigidity. For precise determination of deformation or sagging of buildings in ice-saturated thawing ground, special values of coefficients are recommended (table 2). ***Copy seen:*** DLC.

Text in Russian. ***Title tr.:*** The Anyuyskiy Volcano and problems of Quaternary volcanism in northeastern U.S.S.R.

Describes an extinct volcano discovered by an air survey of the Bol'shoy Anyuy River basin in 1952, and investigated by the writer the next year. The typical, well-preserved crater is located on the upper Monni River (approx. 67°24′ N. 164°30′ E.) at the intersection of several tectonic fractures. The upper part of the Monni is covered by the main lava stream of the volcano, the river water flowing beneath the lava. Stratigraphic, petrographic and botanical studies indicate that the eruption occurred in the late Quaternary, possibly only a few centuries ago. Other Quaternary volcanoes found in northeast Asia are noted: in the Moma valley (66°26′ N. 143°06′ E.), on Taygonos Peninsula (61°20′ N. 161° E.), in the Magadan region, and at Lake Elgytkhyn on the Anadyr Plateau; the considerable tectonic movements evidenced by them are discussed. The volcanoes' locations are indicated on the structural sketch map (p. 94).

Recounts trip of a four-man party in summer 1953 to a volcano discovered by a 1952 air survey in the unexplored area of the upper Monni River in the Kolyma basin: from Magadan by aircraft to the vicinity of Nizhniye Kresty (68°45′ N. 161°25′ E.), thence 550 km. by boat up the Kolyma, Bol'shoy Anyuy, Angarka, Uyamkunda and Monni Rivers, and the last 55 km. on foot along the barren lava stream filling the former valley of the upper Monni. The party examined the volcano, its cone crater (which they descended to the bottom) and the environs, then returned to the Kolyma River mouth. The cone, red in color, rises 120 m. above the surrounding terrain; the crater is 300 m. in diameter and 90 m. deep. The great amount of ejected lava indicates the force of its eruption estimated at some 300–500 years ago, in view of the absence of vegetation and little weathering. No traces of present-day activity were found. Events of the trip, travel conditions, visit to the settlement of Pyatistennoye (67°58′ N. 161°24′ E.) on the Bol'shoy Anyuy River, abundance of fish and game, etc. are noted. The book is favorably reviewed in *Vokrug Sveta*, 1957, no. 1, p. 62. ***Copy seen:*** DLC.

55687. USTINOV, G. O tipe kapital'nogo zhilogo doma na Severe. (Arkhitektura SSSR, 1957, no. 2, p. 41–42, diagr.) Text in Russian. ***Title tr.:*** The basic type of residential building in the North.

The apartment house for the permafrost region is described; open space in the basement for free air circulation and non-heated storage rooms for food and fuel must be provided. The living area of the apartment must be larger than in the mid-continental zone due to its greater use in the North. Size and arrangement of windows are restricted by heat loss and short, if any, daylight during winter. Heat-insulated inner shutters and better insulated window frames can be used in the case of large windows. With well insulated building walls, the main infiltration of cold air during high wind is by the windows. Selection of the optimum width and height of the building and problems in prevention of freezing of windows and in ventilation openings must also be considered. ***Copy seen:*** DLC.

Institut mashinovedeniîa.) 58 refs. Text in Russian. ***Title tr.:*** Strength and ductility of metals at low temperatures.

The subject is developed along three main lines: correlation of previous work, study of metallurgical and metallogical factors, and of the role and influence of different mechanical factors on the strength of metals (concentration of stresses, application of loads, etc.). The physical nature of different phenomena appearing in the processes of deformation and destruction of metals at very low temperature is not yet clearly defined. Some cold-brittle metals of body-centered lattice become very brittle at low temperature, but some non-cold brittle, of side-centered lattice, possess considerable ductility, even at the temperature of liquid hydrogen. The ductility of some nonferrous metals and austenitic steels increases with lowered temperature simultaneously with considerable increase of breaking stresses. All these brittle and ductile conditions are investigated, in relation to suddenly applied and steady loads, with analytical and graphical correlation of results. Analysis of construction crashes apparently due to lowered temperature, indicates the presence of concentrated stress. Three-dimensional distribution of these stresses in loaded specimens is analyzed at various temperatures (+20°, −50°, −196° C.) for brittle and ductile breakdown. Apparatus and method for testing are described in detail (p. 93, 104–108). Resistance to metal fatigue at low temperatures is discussed with graphs and tabulated data (p. 133–37). Appendix contains data tables (35) on mechanical properties of various alloys at low temperatures obtained in the U.S.S.R. (carbon steels 1–6, non-ferrous metals 7–14) and (15–35) abroad.

Describes variants of the peasant log-cabin (izba) used by Russian settlers of the 17th to early 19th century in the Angara and Kuda River valleys. The houses usually built along the post road formed drawn-out villages with a geometric ground plan typical for the area. Homesteads erected on substructures consisted of living quarters, one or two enclosed yards, and attached or separate farm buildings (rich households) or storage rooms (middle-class families). A typical local variant of the north Russian log-cabin is the L-shaped house with a protruding one- or two-storied anteroom (tambur), replacing or built as addition to the usual hall (seni), and a covered porch (kryl'îso), an architectural form deriving from the old Angara region barn. Architectural details, decorative motifs, floor plans etc. are discussed.

55714. VALENTIN, HARMUT. Die Küste der Erde. Gotha, 1952. 118 p., tables, diagrs., 2 col. fold. maps. (Petermanns geographische Mitteilungen. Ergänzungsheft, no. 246.) 613 refs. Text in German. ***Title tr.:*** The coasts of the earth.

Presents geomorphology of the coasts with special attention to two problems: how far it is possible to include all forms of coasts under one system in order to draft a new coastal morphology; and how far a regional review of the sea coasts may contribute to an explanation of the present state of the coast of the earth. In the first part, the origin and development, form and present state of the coast are reviewed with respect to epeirogenetic, orogenetic, and eustatic movements. In the second part, the general, local and regional states of littoral forms are considered. In conclusion, a scientific approach to possible future changes in coasts and a coastal morphology are discussed. A fold. col. map (scale 1:50,000,000) on the present state of coast classification focuses on coastal forms indicating advance by emergence, contraction or coastal retreat, by submergence or destruction from glaciation or erosion, and by cliff building. This map includes all arctic regions. Another map (same scale) reviews formation of the earth's coasts, including arctic coasts of Canada and Europe. ***Copy seen:*** DGS.

Fifteen main patterns of population distribution in rural areas are distinguished and their occurrence is shown (map); their relation to occupation is discussed. Settlement patterns of fishers, hunters and reindeer breeders in the arctic and sub-arctic areas are outlined (p. 7–11). ***Copy seen:*** DLC.

55719. VAN ALLEN, WILLIAM HOWARD. The story of Canada's airports. (Canadian geographical journal, Nov. 1957. v. 55, no. 5, p. 190–203, 30 illus., text map.)

Northern airports at Churchill, Yellowknife, Norman Wells, Southampton Island, Frobisher Bay, Chimo, Baker Lake, Eureka Sound, and Cornwallis Island are noted; also landing strips at the U.S.-Canadian arctic weather stations and at DEW and Mid-Canada Defence Line stations. Aklavik and Fort Smith, Mackenzie District, have new and improved (respectively) airports. Frobisher on Baffin Island Canada's northernmost civil airport, is to be refuelling and jumping-off place for interhemisphere travel by the polar route.
Copy seen: DGS.

55720. VAN ALLEN, WILLIAM HOWARD. Transportation north of sixty. (Canadian geographical journal, Sept. 1958. v. 57, no. 3, p. 112–16, illus.)

Surveys present conditions, and plans for future expansion of air, water, rail and highway transport in northern Canada. There are nearly 120 ports, airports, and landing strips in the area (one, Frobisher, on a trans-polar route). The Dept. of Transport is constructing ice-breakers for arctic use, and considering the application of nuclear power to future ice-breakers. A District Marine Agency was established in 1956, with headquarters at Fort Smith, Mackenzie District, to provide for the increasing transport. Traffic on the 600 mi. Athabasca-Great Slave-Mackenzie waterway rose approx. 300%, 1945–1955. A proposed rail line to Great Slave Lake is noted. Work has started on road and bridge construction: roads in Yukon Territory connecting the Eagle Plain oil area and the Clinton Creek base metals and asbestos deposits with the existing highway system; bridges across the Pelly, Yukon and Stewart Rivers in Yukon Territory; a 550 mi. Great Slave-Great Bear road in Mackenzie District; etc. Map shows existing roads and projected construction.

Includes: Medetera arctica, new name for *M. bicolor* described by the writer, from Alaska (No. 43108). "A *Medetera bicolor* was described from Central Europe in 1838." ***Copy seen:*** DSI.

55725. Van ECKHARDT, H. P. Crevasse detector blazes glacial trails. (Electronics, Jan. 1958. v. 31, no. 3, p. 63–65, illus., diagr.)

Describes a tractor-mounted detector-system used with success in Greenland and the Antarctic. A double-system of electrodes, each consisting of four large dishpan-shaped sled electrodes, is pushed in front of the vehicle in a fan-wise arrangement on wooden booms. In contact with an ice-snow surface, the electrodes set up an electrical field in the ice pack and pick up constant readings when the ice is solid. As the tractor approaches a crevasse, bridged with snow, the flow of electrical current is disrupted and an alarm warns the operator. The detection effect is obtained by using the crevasse walls to simulate a capacitor. Small, hand-towed units have also been tested with fair success. ***Copy seen:*** DLC.

Contains data and notes on 16 kinds of mouse tumors isotransplanted after storage of 3–10 or 80–100 days at −79° C. Results indicate that not all tumors are viable after this storage; especially ovarian, adrenal and liver tumors failed to take. ***Copy seen:*** DNLM.

55730. VANSTONE, JAMES WILLARD, 1925– . An archaeological reconnaissance of Nunivak Island, Alaska. (Alaska. University. Anthropological papers, May 1957. v. 5, no. 2, p. 97–117, illus., map.) 36 refs.

Describes and compares the stone, bone and pottery artifacts excavated in five sites on the northern and two on the southern coast of Nunivak in 1952. The fragmentary state of pottery and implements yielded by the test pits prevents an exhaustive comparative study though certain affinities are noted between the recent-prehistoric culture of the Nunivak Eskimos and the archeological material from Hooper Bay village (No. 24907) and late developments in northern Alaska. The discovery and exploration of the island are outlined, and statistical data on its past and present population given. ***Copy seen:*** DLC.

55731. VANSTONE, JAMES WILLARD, 1925– . *Editor.* The autobiography of an Alaskan Eskimo. (Arctic, 1957. v. 10, no. 4, p. 195–210, illus.)

Recollections of Attungoruk, a Point Hope Eskimo born in 1928, of his childhood and school days, early trapping and hunting adventures, adolescent courtships, various short-term jobs at Candle, Kotzebue, Alaska Railroad, Eielson Air Force Base, etc.; his return to Point Hope, marriage and birth of children. It is a life pattern of a typical North Alaska Eskimo who seeks summer employment outside his village to supplement income derived from winter hunting. Attungoruk's narrative is prefaced and annotated by VanStone who conducted areal community studies from Sept. 1955 to Aug. 1956. ***Copy seen:*** DLC.

55732. VANSTONE, JAMES WILLARD, 1925– . Commercial whaling in the Arctic Ocean. (Pacific Northwest quarterly, Jan. 1958. v. 49, no. 1, p. 1–10, illus., map.) 42 refs.

Deals with the American whaling industry in the Bering-Beaufort Seas area, 1848–1914, and its decline. Whale oil and baleen production, hazards of ice and storms, introduction of steam vessels (1880) enabling whalers to winter in the Arctic, methods of catching, etc. are discussed. Financial aspects: costs of outfitting, sharing of proceeds, prices, are considered. Northwest Alaskan Eskimos still carry on some whaling, their equipment similar to the commercial whaler's, but their catch is used chiefly for food. Factors in the decline of the industry were shipping hazards and loss of the baleen market to steel and other substitutes. ***Copy seen:*** DGS.

55733. VANSTONE, JAMES WILLARD, 1925– . An Eskimo community and the outside world. (Alaska. University. Anthropological papers, Dec. 1958. v. 7, no. 1, p. 27–38.) 9 refs.

Study, in a time perspective 1900–56, of the interrelation between the northwest Alaskan Eskimo village of Point Hope (pop. approx. 250) and the outside world through missionary work, schooling and trade. The changing pattern of contacts responsible for the disappearance or decline of aboriginal customs and the introduction or development of a new social order and way of life are discussed: decline of the large family unit, men's house, reindeer herding, commercial whaling, etc., and introduction of a formal community organization, school, health and welfare services, technological devices, modern transportation and communications, curio industry, etc. A gradual acculturation process is preferable to an abrupt change following a sudden

impact of modern civilization. Author's 1955–56 field studies at Point Hope were supported by the Arctic Aeromedical Laboratory, Ladd Air Force Base, Alaska.

55737. VASIL'EV, B. A. Medvezhiĭ prazdnik. (Sovetskaia ėtnografiia, 1948, no. 4, p. 78–104, illus.) Approx. 80 refs. Text in Russian. ***Title tr.:*** The bear festival.

An analysis of bear rites and bear worship based primarily on author's research among the Orochi (Tungus) in 1927. The rituals connected with: hunting, killing, and skinning of the bear, severing of sex organs, etc., carving and cooking of the carcass, burial of skull and bones to assure the animal's resurrection, raising of bear cubs in captivity and their sacrificial slaughter, etc. are discussed. A chronological cultural development of the bear cult is suggested: the first and older stage (hunting) encompasses the entire north of Eurasia and America, the second and younger (caged bear) is found only among the Pacific coast tribes including the Amur region, coastal Chukchis, Koryaks and Kamchadals. This latter stage is related to cults of southern Asia and spread north with the advance of the Ainus. ***Copy seen:*** DLC.

55741. VASIL'EV, VIKTOR NIKOLAEVICH, 1890– . Diz'îunktivnye i sploshnye arealy. (Botanicheskiĭ zhurnal, May 1957. t. 42, no. 5, p. 709–727, 4 text maps.) 20 refs. Text in Russian. ***Title tr.:*** Disjoint and continuous distribution.

Contains a study of various types of distributional areas: intraspecific disjoint areas, disjoint areas of related species, continuous areas of related species, and disappearing and disappeared areas. Many examples of such plant distribution in boreal and arctic regions of Eurasia are cited. One of the principal causes of disjunction of areas is the dying-out of plants in the limits of a continuous area under the influence of changing climatic and other environmental conditions. The editorial board of the journal considers this treatment preliminary and inconclusive and invites other plant geographers to join in the discussion of the problem. ***Copy seen:*** DLC.

55741A. VASIL'EV, VIKTOR NIKOLAEVICH, 1890– . Flora i paleogeografiîa Komandorskikh ostrovov. Moskva-Leningrad, Izd-vo Akademii nauk SSSR, 1957. 260 p. tables. (Akademiîa nauk SSSR. Dal'nevostochnyĭ filial im. V. L. Komarova.) 103 refs. Text in Russian. ***Title tr.:*** Flora and paleogeography of the Commander Islands.

Monographic study based on earlier investigations and collections, including Steller's work in 1741–42, Stejneger's studies of 1882–83 and 1895–97, and A. I. Kardakov and E. A. Kardakova's collections in 1928–31. A systematic list of 345 species is the main part of the book (p. 17–198): 21 Pteridophyta, 2 Gymnospermae (*Pinus pumila* Pall. and *Juniperus sibirica* Burgsd.), 86 Angiospermae monocotyledones and 236 Angiospermae dicotyledones, with Latin and Russian names, description, information on locality, collector, date, etc., and on where the specimen is preserved; data on distribution, type of area of occurrence, and on economic significance. An introductory account of the Commander Islands is given (p. 8–14), their geomorphology, hydrology, the soil types and their vegetation. Comparison of this flora with that of neighboring areas is discussed (p. 202–208); and types of plant associations are analyzed (p. 208–226). The history of the flora and paleogeography of the whole area of the hypothetical ancient continent "Beringia" now covered by the Bering Sea is outlined (p. 237–42). An annotated list of literature, and indexes of the Russian and Latin plant names are added.

43 refs. Text in Russian. ***Title tr.:*** Climatic conditions in Eastern Siberia in the Pleistocene.. Paper delivered at the Conference on the Quaternary period, Moscow Jan. 13–16, 1953, together with author's addition, editorial comments and discussion arising in the conference.

Author challenges the view held by the majority of Russian scientists that the climate in the Pleistocene was rougher than at present. He questions also that the configuration of dry land was the same as at present, and that glaciation in East Siberia was only of mountain glacier character. Re-examination of Pleistocene floral and faunal data is reported from Kamchatka and the basins of Aldan, Indigirka, Kolyma and other rivers. Maps showing dry land and water distribution during different periods are attacked. S. Miki, M. Jakoyama, I. D. Cherskiĭ, I͡U. N. Popov, V. N. Sukachev, N. M. Strakhov and others favor the writer's views but editors' remarks and the discussions indicate that the matter is in dispute.

Discusses the Tungus, pre-Tungus and Chukchi-Koryak origin of river names in the taiga and forest-tundra zone between the Yenisey River and the Sea of Okhotsk. The geographic pattern of the toponymics suggests an ancient occupation by an aboriginal, pre-Tungus, Ural-Altaic population and points to the Tungus migration routes spreading north and northeastward from the Angara-Yenisey region, mainly along minor waterways. The prevalence of Tungus names in the basins of the Yenisey, Nizhnyaya and Podkamennaya Tunguska, and upper Angara Rivers indicates their early occupance by Tungus groups, while the scarcity of Tungus toponymics along the right tributaries of the Lena and Amur Rivers suggests a late penetration into the area east of the Vitim. The presence of Chukchi-Koryak river names in the Podkamennaya and Nizhnyaya Tunguska basins is noted and a prehistoric admixture of local Paleo-Asiatic (Tungus-related) elements inferred in the ethnic composition of present-day reindeer-herding Chukchis and Koryaks. ***Copy seen:*** DLC.

Title tr.: The Tungus caftan, its historical development and areal distribution.

Describes the evolution of this garment from a close-fitting, tailed coat with breast-piece, used by ancient foot-hunters, to a loose, open, coat adapted to riding reindeer-back. Originally worn by the Evenki, Eveny and Negidal'tsy of the tundra and taiga zone between the Ob-Yenisey watershed and the Sea of Okhotsk, the Tungus caftan followed the spread of reindeer economy north and northeastward to Chukotka. The study is based on some hundred caftan variants in the Museum of Anthropology and Ethnography. The pelts, patterns and cut, ornamentation, etc. of both tailed and tail-less man's and woman's coats are discussed and illus. Parallels are drawn between this caftan and the similarly tailed garment of the Athapaskans (Copper River) and Eskimos. The traditional ornamental details of the Eskimo parka indicate its evolution from the open, tailed Tungus coat with breast-piece and confirm the Asiatic origin of the Eskimos. ***Copy seen:*** DLC.

Account of experiments with rats kept at 25° and 5° C. receiving adequate and sub-optimal amounts of thiamine in the diet. There were no significant losses or gains in weight between animals kept at both temperatures when the level of dietary thiamine was the same. The animals kept at 5° C. showed an increased uptake of food when compared with the controls. ***Copy seen:*** DLC.

55760. VAUGHAN, DAVID A., *and* **L. N. VAUGHAN.** Effect of cold on thiamine-deficient rats. (Federation proceedings, Mar. 1957. v. 16, no. 1, pt. 1, p. 131.)

Rats kept at 5° C. at deficient thiamine levels showed no weight difference from similar animals kept at room temperature. The cold rats used increased food for extra energy requirement, which suggests that thiamine needs in the cold are governed by caloric requirements.

55761. VAURIE, CHARLES. On the validity of *Acanthis flammea islandica* Hantzsch. (Dansk ornithologisk forening. Tidsskrift, Feb. 1957. årg. 51, hefte 1, p. 9–11.) 5 refs. Summary in Danish.

Contains a taxonomic comparative study of this redpoll, based on material from Iceland (*A.f. islandica*) and from Greenland (*A.f. rostrata*). Author's former opinion, that they should be synonymized, has changed, though the two forms are not well differentiated and not constantly separable. The problem requires further study: if the validity of *islandica* is accepted, it can be separated from *rostrata* only on the basis of the differences in coloration.

55773. VEGARD, LARS, 1880– . Recent progress relating to the study of aurorae and kindred phenomena. Oslo, H. Aschehoug, 1958. 16 p. illus., tables, graphs. (Norske videnskaps-akademi i Oslo. Geofysiske publikasjoner, v. 20, no. 4.) 31 refs.

Studies of auroral observations at Oslo and Tromsø (69.7° N. 18.9° E.) showed that the structure of the ionosphere, the zodiacal light, the solar corona, and the bundles of electric rays which produce auroras and most magnetic disturbances, are due to photoelectric effects of solar X-rays of various frequencies and distributions. The rays are formed by photoelectrons from the sunspot area and are neutralized by positive ions, mainly protons with velocities of at least 2×10^8 cm./sec. Recently detected enhancements of atomic lines were found to be due to increase in the relative proton flux. Temperature measurements from N_2+ bands corresponding to altitudes of several hundred km. gave no indication of increase of temperature with altitude. ***Copy seen:*** DGS.

Text in Russian. ***Title tr.:*** Frozen curtain in construction of the spillway in the Gor'ky hydroelectric plant.

Method of eliminating filtration and hydraulic pressure of ground water, restricting effective construction at the spillway, is described in detail. Underground formation contains many sand layers at the 10–12 m. levels, carrying water into the excavation for the spillway and channels. Wells (875) were drilled to 12–18 m. depth for cooling columns, which form a "frozen curtain" 740 m. in length, and prevent water filtration into the excavation. The refrigeration plant, operating on calcium chloride solution, has a capacity of 2½ million cal./hr. and by means of these columns it can maintain a five-month average ground temperature of about −18° C., permitting construction of the basic wall to sufficient depth. During dismantling of the freezing arrangement, circulation of steam through the columns for two months was not sufficient to defrost the ground.

Presents results of laboratory tests of the effect of de-icers on the surface scaling of non-air-entrained and air-entrained concretes, each made with two different coarse aggregates, cured differently, and tested under a variety of procedures. It was found that all the chemically dissimilar materials which function as de-icers also cause "salt" scaling, and that relatively low concentrations produce more surface scaling than higher concentrations or the absence of de-icer. A period of air drying on the concretes prior to the start of scaling tests increased the resistance to surface scaling, and no scaling was produced when the concrete surface had no free water on it during the freeze portion of the cycle. Concrete made with Elgin sand and Eau Claire gravel showed more resistance to surface scaling than concretes made with Dresser trap rock fine and coarse aggregate.

(Grønland, Dec. 1957. nr. 12, p. 447–53, illus.) Text in Danish. ***Title tr.:*** Some comments on the police service and the judicial system in Greenland on the occasion of the replacement of the first group of Danish police officials.

A new administration of justice act came into effect in Greenland in 1951 and personnel on loan from the Danish police forces, were relieved after six years. Among suggestions for the future: the Danish police should attend special courses on Greenland conditions before taking up appointments there; change of personnel every five years is unsuitable, a different arrangement should be sought; Greenland police officials should have preliminary training in Greenland; police powers to waive a charge in certain cases should be extended; the appointment of a legally trained defense counsel for Greenland is premature; total prohibition of private distilling should be introduced. The remand home at Godthåb for six people, opened in 1956, is described.

55795. VEYRET, PAUL. La neige au Canada. (Revue de géographie alpine, 1951. t. 39, fasc. 3, p. 533–70, text map, 2 tables.) 18 refs. Text in French. ***Title tr.:*** Snow in Canada.

Comprehensive study begun at the Université de Montréal in 1950; based upon summaries from the Meteorological Service of Canada, and other sources. Snow is described: regional and seasonal

distribution, number of days with snow, monthly and annual variation, exceptional snowfall, relative amounts of snow and rain, and effects of wind upon snow. Considerable reference is made to snow in arctic and subarctic regions despite a sparse net of stations. Winters with snow-covered ground are expected in nearly all of Canada. The effect of snow on people in both cities and rural areas, preparations and adjustments to it, also Canadians' ability to continue normal winter activities are discussed. Two critical periods occur in the systematic use of snow for movement or transportation: the time of freeze-up and of break-up. These periods depend closely on: the earliest date of mean daily temperature below freezing (beginning of freeze-up), earliest date in spring when mean maximum temperature goes above freezing (daytime thaw, nighttime freeze), earliest date when mean temperature rises above freezing (rapid break-up). Aesthetic values of snow are noted in conclusion. ***Copy seen:*** DGS.

Field experiments at Igarka Permafrost Station 1950–1953 are described. Heaving forces were computed from the flexure of a horizontal H-beam (hinged between stationary supports) under the pressure exerted by a wooden stake set in the ground to the full depth of the active layer, or determined directly with a spring dynamometer mounted in one of the stationary supports. Heaving took place only after a frost depth of 8–10 cm. was reached and stopped 20–30 days before the entire active layer had frozen. Some settling of the ground was noted (0.8 cm.) after heaving reached its maximum (11–31 cm.). The heaving forces varied from 70–80 kg. per running cm., measured maximum was 104 kg.—From SIPRE. ***Copy seen:*** DLC.

55807. VIK, ROLF. Studies of the helminth fauna of Norway I, taxonomy and ecology of *Diphyllobothrium norvegicum* n. sp. and the plerocercoid of *D. latum* L. (Nytt magasin for zoologi, 1957. v. 5, p. 26–93, 8 illus., 14 plates, 31 tables.)

120 refs. Contrib. no. 67, Zool. Mus., Univ. of Oslo.

Altogether 2,919 fishes, 313 birds and 593 mammals from different parts of the country were examined for parasites in 1943 and 1950–1957, and results are presented regarding *Diphyllobothrium norvegicum* n. sp. and *Diphyllobothrium latum* (L.). Feeding experiments (111) with different types of plerocercoids were carried out on 14 species of birds, three mammals, and man. *Larus argentatus, L. canus, L. marinus, L. ridibundus, Sterna hirundo, Ardea cinerea, Pica pica,* cat, rat, and man have been found definite hosts of *D. norvegicum* n. sp. In *Mergus serrator, Colymbus arcticus* and *Ardea cinerea,* another *D.* sp. has developed. Infection of *Homo* with *D. latum* plerocercoids from perch and pike from Pasvik proved positive. The *D.* sp. infections in *Homo* are described with pathological effects and treatment. The various development stages of *D. norvegicum* are described; it was found (adult stage) in mammals and birds in natural infection, and only in areas where the plerocercoid was identified in trout or char. The plerocercoid stage of *D. latum* was found in the Pasvik fish and the species established as an endemic parasite of Norway. The second intermediate hosts are discussed. Precautions are given against the spreading of the two human parasites.

55830. VITÎAZEVA, VALENTINA ALEKSANDROVNA. O razvitii Pechorskogo ugol'nogo basseĭna. (Planovoe khozîaĭstvo, Nov. 1957, no. 11, p. 79–83, tables.) 3 refs. Text in Russian. ***Title tr.:*** Development of the Pechora coal basin.

Known and probable reserves of the Pechora coal basin are estimated at 262 billion tons, of which 19.2 billion are known; in 1956, the annual output of its 35 coal mines with 37.7 thousand miners and 103.6 auxiliary workers, reached 15.4 million tons. The coal is of various types, ranging from lignite to semi-anthracite, and the seams are convenient for mining. Coal types and output are compared with those of other Soviet coal basins; the slow development and relatively high cost of Pechora production are noted; the possibility is claimed of increasing the annual output to 57–80 million tons. Coal deposits of Vorkuta, Inta, Seyda, etc. are mentioned.

Izvestiia, 1889. t. 20, no. 1, p. 1–42, table; no. 2, p. 1–31, 5 fold. plates of illus. at end.) 15 refs. Text in Russian. ***Title tr.:*** Traces of the stone age in the Angara River valley.

Sketches the history of the Angara valley, its economic development to the mid-17th century, unsuccessful attempts to increase the river's navigability and its decline as a trade route. Author's 1882–1887 (?) trips along the Angara, archeological discoveries on its upper (No. 48768, 48769), middle and lower course, chance finds (including several stone fish on the Verkholensk mountain, near Irkutsk) are dealt with. The Irkutsk area burials discovered in 1887 are reported and their cranial material described and tabulated. A stratified site was excavated in 1882 at the Chadobets River's confluence with the Angara; the finds are described: chipped and polished stone artifacts (celts or pestels, axes, scrapers, points), ornamented (linear, hole-comb) pottery fragments, bronze and iron implements (axes, arrowpoints, scrapers). Some of the stone and metal finds are illustrated in lithographs.

Kratkie soobshcheniia, 1958. vyp. 29, p. 30–37, illus., sketch maps.) 15 refs. Text in Russian. ***Title tr.:*** Settlement types in the European North and the time of their appearance.

Discusses the influence of economic development on village planning patterns in northern Russia, including the White Sea coastal area. Five types are differentiated: street alignments (houses facing each other), lake- or river-oriented house-rows, south-oriented house-rows, planless villages, and ring-formation: dwellings grouped around church or village green. An ethnic explanation for the origin of these village types is rejected due to the comparatively late appearance of village-like settlements in the sparsely populated North. Earliest (16th–17th century) was the planless village (agglomeration of individual homesteads); with subsequent development of river and lake traffic, houses faced the waterways; similarly, overland trade of the 19th century resulted in double rows of houses facing the road.

tr.: The cluster-type settlement of the Russian North and its origin.

Discusses the tendency of one- or multi-homestead hamlets to group into a large village, typical of Arkhangel'skaya Oblast' and western Karelia settlement since the 15th–16th centuries among both the aboriginals and the Russians. Such village clusters bear a collective name, often of non-Russian (pre-Russian?) origin, as well as individual Russian hamlet names, the latter, usually, with patronymic endings. This seems to confirm the supposition of hamlets being originally unions of family homesteads, and joining other kin groups to form larger village units. An economic-patriarchal origin for this type of settlement is tentatively suggested.

English. ***Title tr.:*** New data on the geology of Kamchatka and its ore prospects.

Presents new views on geology and occurrence of ores in Kamchatka Peninsula based chiefly on recent geologic mapping (at scale 1 : 1,000,000 and 1 : 500,000), field investigations and prospecting. The geologic structure and formation of ore are found to be much younger than was hitherto believed. Kamchatka, it appears, was folded mainly in the Alpine mountain-building period and consists of Upper Cretaceous rocks. The main structure is defined by a central massif and two parallel fold arches which cross the peninsula in a northeasterly direction. Tectonic regions are outlined, and a structural map is presented. Occurrence of ores is mainly bound to the development of geosynclines in the post-Neogene period. The main regional formations are defined, and the regions characterized in turn. Hydrothermal processes in formation of ores are stressed. At present the leading metals of Kamchatka are copper, molybdenum and mercury. Conditions are favorable for gold and silver. Other metals of possible importance for production are barium, antimony, arsenic and selenium. Geologic mapping (at scale 1 : 200,000) of areas with ores indicated and further prospecting are considered of first importance.

55856. VOKES, FRANK M. The copper deposits of the Birtavarre District, Troms, northern Norway. Oslo, H. Aschehoug, 1957. 239 p. illus., maps (3 fold.), diagrs., graphs, cross-sections, 27 tables. (Norway. Geologiske undersøkelse. Skrifter 199.) 59 refs. Text in English. Summary in Norwegian.

Contains results of investigations during 1952–1955 by the Norwegian Geological Survey in the area 69°30′ N. 21° E. at the head of Kåfjord (inlet of Lyngenfjord). Chalcopyrite-pyrrhotite ores were mined there in 1900–1919, and these investigations were to determine possibility of reviving mining as part of the "North Norway Plan." Physical geography is briefly described; stratigraphy and structure were reported in No. 41752. Geology of the ore deposits is discussed in detail. Types of ore, mineralogy, metasomatic alteration along ore-zones, and origin of the ores are dealt with; also history of mining and economic

factors. Each of the individual workings in the area is described in detail, with brief evaluation of prospects. The copper content (low) does not warrant capital investment necessary for mining in the foreseeable future.

Copy seen: DGS.

The effects of arctic climatic conditions are discussed in relation to apartment house construction. Typical designs for the mid-continental zone must be changed for the structure to withstand not only continuous low air temperature (−45° C.), but especially, high winds and snow storms. General arrangement and directional (meridional) orientation of the building to minimize effect of predominant cold winds are discussed, also arrangement and size of windows to provide cross ventilation and maximum illumination, to prevent great heat losses and to offset effects of prolonged light and dark periods of summer and winter. More attention to specific conditions of the North is suggested in development of basic house designs. ***Copy seen:*** DLC.

55872. VOROB'EV, A. Ledîanoĭ plot. (Znanie-sila. Apr. 1957. god 32, no. 4, p. 5, illus.) Text in Russian. ***Title tr.:*** Ice-float.

Project for a polar station on an artificially made ice-island is briefly outlined with illus. A refrigerating plant with a special set of piping is to be landed on drift ice in a region indicated. The assembled pipes are to be arranged as the frame for walls of living quarters, storage and service compartments. Water sprayed over the cold piping will form strong ice walls. The living quarters, laboratory and machinery sections are to be well insulated. The refrigerating plant, which may be operated on atomic energy, will maintain cold temperature in the ice-float without difficulty even when drifting through warm waters.

Text in Russian. ***Title tr.:*** Analysis of the orientation of adjustments in river valley courses in southeast Taymyr applied to study of recent tectonics.

The method of analysis consisted of compiling from a map, in scale 1:500,000, the azimuthal directions of tributary course segments measuring 5 km. or more on both sides of the Khatanga, in all 174

511326—60——79

such measurements on the left and 128 on the right of the stream. The azimuthal directions were plotted on a rose diagram which was compared with a similar diagram representing the courses of main tectonic fractures in the eastern part of the Taymyr Peninsula depression (approx. 71°40′–72°20′ N. 102°–106° E.). The main tectonic fracture lines were detected by aero-magnetic survey. Comparison of the diagrams reveals that river valleys show accommodation to the tectonic fractures and therefore it is concluded that study of river valley courses serves to reveal recent tectonics.

Text in Russian. *Other authors:* V. G. Morachevskiĭ *and* V. ÎÂ. Nikandrov. ***Title tr.:*** Using solid carbon dioxide for cloud dispersal in the Arctic.

Reports results of fog- and cloud-seeding experiments with dry ice: 21 were carried out in summer 1956 by the Arctic Institute; two are described in detail; one in the Gydan Peninsula area on Sept. 23, the other on Sept. 22 in the region of Tadibe-Yaga, a polar station on Obskaya Guba at 70°22′ N. 74°08′ E. Cloud or fog to 500 m. thickness with wind to 10 m./sec. and temperature −4° C. or lower could be dispersed for one hour on a 50 sq. km. area by spraying 20 kg. dry ice. The spraying operation and clearing process take about an hour. Technical details are discussed. Number of days with fog each month May–Oct. are tabulated (p. 133) for the chief polar stations along the Northern Sea Route. ***Copy seen:*** DLC.

55894. VOSKRESENSKIĬ, S. Desîât' tysîâch. (Neva, June 1957, no. 6, p. 125–30, illus.) Text in Russian. ***Title tr.:*** Ten thousand.

Short story describing a reindeer-mounted geological survey party crossing the scorched taiga in Yakutia during summer, and their flight from a devastating taiga fire. ***Copy seen:*** DLC

55906. WAGER, LAWRENCE RICKARD, 1904– . Sulphides in the Skaergaard intrusion, East Greenland. (Economic geology, Dec. 1957. v. 52, no. 8, p. 855–95, tables, microphotos, cross-sections, diagrs.) 43 refs.

Previous reports on this intrusion (No. 19034, 38141) deal with the general geology, structure, petrology, mineral composition and formation. This study, following discussion of the sequence and origin of the chief rock types of the intrusion, describes in detail the textural relations and distribution of the sulphides, found in small quantities throughout the six rock types. The Skaergaard intrusion, originally a pool of basic magma about 300 km.^{3} in volume, was markedly differentiated by strong crystal fractionation to produce a range of rock types from ultrabasic to acid. Sulphide minerals, in general inconspicuous, occur in certain horizons. In the layered complex up to the latest ferrogabbros, sulphides occur in small units about 0.4 mm. across and form about .02% by weight of the rock. They are bornite, digenite and chalcopyrite with some covellite replacing the digenite. In melanocratic bands, copper sulphides are ten times as abundant as in average rock. In the ferrogabbros at the top of the layered series droplet-shaped patches of pyrrhotite with a little chalcopyrite but no bornite make up about 2% of the rock. The composition of latest pyrrhotite is determined and the composition of earlier immiscible copper sulphide and iron sulphide liquid is indirectly estimated. The amounts of cobalt, palladium, indium and gold has been determined in selected rocks. The petrology of this differentiated intrusive is discussed in detail.

Appendix by Paul Bartholomé, E. A. Vincent and A. A. Smales: *Theoretical considerations on the separation of the sulphides and their crystallization* (p. 895–903, diagrs., 13 refs.) states that the sulphide globules of the Skaergaard gabbros have a fairly simple mineralogical composition, and on the basis of thermodynamic calculations, confirms the results in the main paper concerning the sulphur and copper contents of the magma during differentiation. ***Copy seen:*** DGS.

55907. WAGNER, GERHART. Die Brutvögel von Röst, Lofoten. (Stavanger, Norway. Museet. Sterna, May 1958. bd. 3, hefte 2, p. 59–72, 4 illus., 2 tables.) 11 refs. Text in German. Summary in Norwegian. ***Title tr.:*** Breeding birds from Røst, Lofoten.

Lists 81 species (43 breeding) observed in 1956–57 on this island group (67°30′ N. 12° E.), with ecological and bio-ecological notes on some species. Breeding data of *Fulmarus glacialis, Ardea cinerea* and remarks on frequency of the bridled guillemot (*Uria aalge aalge*) are added.

and wintering of the starling, *Sturnus vulgaris*, north of the Arctic Circle in Norway.

The European starling is the commonest breeding bird near human habitation on Lofoten and Vesterålen, and along the Norwegian coast to 70° N. The frequency increases from south to north and from west to east between 70° and 71° N. This bird was not observed breeding in Honningsvåg and Vardø. Lofoten and Vesterålen seem to be its winter headquarters. ***Copy seen:*** DI.

55909. WAGRET, PAUL. Le climat se rechauffe-t-il? (Nature, *Paris*, Jan. 1958. no. 3273, p. 19–23, illus., table.) Text in French. ***Title tr.:*** Is the climate warming up again?

Reviews evidence indicating a warmer climate: melting ice islands, retreat of ice packs, glaciers; longer ice-free periods on northern rivers, and at sea; retreat of the permafrost limit; rise in registered air temperatures; etc. Effects of the warmer climate on plant and animal life are noted: new appearances, longer sojourns of birds in the North; northward advance of fish, e.g., cod, and northward retreat of polar bears, seals and narwhales; recession of the tundra before encroaching taiga; and northern extension of grain cultivation (partly result of new techniques). Reasons for these changes as evidenced in various northern areas are discussed, and some theories elucidated; but the basic causes, and whether the amelioration is a long-term trend or merely a cyclic variation are not known.

55910. WAHL, EBERHARD W. Mean monthly 300- and 200-mb. contours and 500-, 300- and 200-mb. temperatures for the Northern Hemisphere. Bedford, Mass., Apr. 1958. 80 p. text map, 63 charts. (U.S. Air Force. Cambridge Research Center. Geophysical research paper, no. 57.) 5 refs.

Mean monthly pressure height and temperature charts were prepared, using chiefly U.S. Weather Bureau's Monthly climatic data for the world. Data for Jan. 1950–Dec. 1955, and for the area south to 20° N. were tabulated, analyzed and plotted. Normal monthly pressure height charts for the 300- and 200-mb. levels are given; temperatures are charted for the 500-, 300-, and 200-mb. levels, though in some areas, isolines of pressure and temperature are only approximate. Sources, reliability and distribution of data, method of chart construction are discussed in text. Remarks on each set of charts, include explanation of extrapolation of isolines into areas of sparse data. ***Copy seen:*** DGS.

55915. WAHRHAFTIG, CLYDE ADOLPH, 1919– . Quaternary geology of the Nenana River valley and adjacent parts of the Alaska Range. Washington, D.C., U.S. Govt. Print. Off., 1958. 68 p., 8 fold. plates in pocket, 29 illus., 5 tables. (U.S. Geological Survey, Professional paper 293–A.) 40 refs.

Outlines glacial history of the region (63°30′ N.–150° W.). A strip 5–8 mi. wide along the Alaska Railroad and Nenana River was studied in detail. Landslides between McKinley Park station and Healy have hindered operation of the railroad almost since its opening. Extensive study of geologic features along the route has been carried out since 1947. Evidence is recognized of four distinct glacial advances along the Nenana; during each advance, the ice moved northward from the Alaska Range to its northern foothills. Alaska was never completely covered by glacial ice during the Pleistocene; a great driftless area included most of the Yukon and Kuskokwim drainage basins. The geographic setting is sketched, and the bedrock geology of the Nenana valley outlined; the Pleistocene history of the region is summarized, including events leading to the glacial advances; the four glaciations are described; deposits and landforms younger than the latest ice advance are noted. Diagrams and photos amplify the text. ***Copy seen:*** DGS.

55916. WALDEN, HANS. Ein Tief mit Warmsektor über dem Grönlandmassiv. (Zeitschrift für Meteorologie, *Berlin,* 1958. Bd. 12, Heft 4–6, p. 147–54, tables, map.) 26 refs. Text in German. ***Title tr.:*** A low with warm sector over the Greenland massif.

Contributes to the disputed question of whether a low can pass over the Greenland massif and the influence of such air masses. Various opinions are briefly evaluated, and data on wind, air pressure and temperature from the icecap station "Victor" (75°55′03″ N. 40°38′22″ E.) of the Expéditions polaires françaises, 1948–1953, are analyzed and illustrated by maps. The opinion of W. Kopp and R. Holzapfel support the view that lows, limited to the higher air layer, pass over the Greenland massif. Some data are given on development of warm sector, but as far as the effects of such passes are concerned, several stations in simultaneous operation over a period of time are required for conclusive data.

55917. WALDEN, HENRIK W. Notes on some Siberian slugs, especially on the type of *Limax hyperboreus* Westerlund. (Arkiv för zoologi, 1956. ser. 2, bd. 10, no. 5, p. 347–66, 22 illus., plate.) 33 refs.

Contains a critical revision of agriolimacid material, collected by the Swedish Expedition to Novaya Zemlya and the Yenisey River in 1876, with special reference to *Limax hyperboreus* from Sopotochnoy Island, on the lower Yenisey (70°05′ N.) which was found to be *Agriolimax laevis.* Another species described as *Agriolimax hyperboreus* by Simroth (type locality: Yakutsk) is renamed *A. sibiriensis* n. nom. Specimens from the Yenisey valley, recorded as *Agriolimax agrestis* by Westerlund have to be assigned to *A. altaicus,* on anatomical grounds, and as a distinct race, to be given the name *A. altaicus transitorius.* ***Copy seen:*** DLC.

55918. WALDEN, ROBERT G., *and others.* Buoy telemeters ocean temperature data. (Electronics, June 1, 1957. v. 30, no. 6, p. 164–67, illus., diagrs., graph.) *Other authors:* D. D. Walden *and* D. N. Frantz, *Jr.*

Describes telemetering system which, when triggered by audio-modulated signal in the 2–3 Mc-band, transmits code signal, two standard tones (for accuracy control of multivibrator), and a third tone which is a function of the transistor-measured temperature. Transistor-receiver of narrow band-width responds only to distinctive trigger-signal of less than a few cycles' deviation in modula-

tion frequency. Transmitter of 30-w. input operates on the receiving frequency; operational range is 300–600 mi. Transmitted signals are received on standard communications receiver, recorded on magnetic tape, and the tone frequency measured with an eput meter. Other quantities than temperature can be measured by substituting the transistor with different transducers.

55924. WALKER, JOHN CHARLES, 1893– . A study of resistance to *Fusarium* wilt in Alaska peas. (American journal of botany, Dec. 1935. v. 22, no. 10, p. 849–57, 7 tables.) 9 refs.

Two strains of Alaska pea (*Pisum sativum*) were studied as to the effect of root extracts upon the wilt organism, one strain homozygous for resistance and the other for susceptibility to pea wilt. The pea-wilt fungus (*Fusarium orthoceras* var. *pisi*) restricted to certain

strains and varieties of the garden pea, invades through the young roots and after the early stages of penetration becomes a vascular parasite. The pea root-rot fungus (*Fusarium martii* var. *pisi*) is non-selective and attacks wilt-resistant and wilt-susceptible strains equally; it invades and parasitizes primarily the cortex of root and lower stem. When extracts from fresh and dried roots were used as a medium for the fungus, growth was usually greater in the extracts from susceptible roots. When the pea root-rot fungus to which both strains of pea are equally susceptible, was compared with the wilt fungus on root extracts, reduced growth in resistant-root extract occurred with the wilt but not with the root-rot fungus.

55928. WALLÉN, CARL CHRISTIAN, 1917– . Inlandsisens ablationsförhållanden under avsmältningsskedet i de nordvästra fjälltrakterna. (Geologiska föreningen, Stockholm. Förhandlingar, 1957. bd. 79, häfte 3, no. 490, p. 529–41, diagr., table.) 12 refs. Text in Swedish. Summary in English. ***Title tr.:*** Ablation conditions of the inland ice during deglaciation in the northwest mountain regions.

Considers problems of estimating the greatest possible ablation rate in the Torneträsk valley during the boreal period while ice remained in the mountains to the west, and of determining mountain glaciers' activity at the time. The estimated climate optimum, based on northern limits of hazelnut growth, and a stationary high pressure system over eastern Europe providing flow of southerly air over Scandinavia, are postulated to provide highest summer temperatures. Precipitation is calculated at 300 mm. in Torneträsk and 3,000 mm. in the mountains. By means of a formula including wind, radiation, time, and other pertinent factors, it is concluded that ice may have diminished at an annual rate of 10–12 m. in the Torneträsk valley and 2 m. in the mountains where glaciers may have shown some erosive activity.

55929. WALLÉN, CARL CHRISTIAN, 1917– . Nederbörden i Sverige, medelvärden 1901–1930. Stockholm, 1951. 48 p., tables, diagrs., 3 fold. col. maps. (Sweden. Meteorologiska och hydrologiska institutet. Meddelanden ser. A, nr. 4.) 12 refs. Text in Swedish. Summary in English. ***Title tr.:*** Precipitation in Sweden, mean values 1901–1930.

Contains a statistical analysis based on data obtained from 721 stations, 200 of which (nine in Norrbotten) were in operation throughout the period. The mean

values of all the other stations (some fifty in Norrbotten) were reduced by common methods to the period 1901–30 with the help of adjacent normal station records. Calculation of mean values and/or reduction with the aid of normal stations was made for each month and for the year. Information is given concerning the location, height above sea level and length of period with screen equipment for all normal stations as well as mean values of precipitation during different months, the year and half-years for the complete set of stations. Maximum and minimum amounts of precipitation recorded at some 50 Swedish stations, since the stations began operation are tabulated. Mean annual precipitation values and station locations are mapped. ***Copy seen:*** DWB.

55930. WALLER, ROGER M. Riverbank erosion and ground-water conditions at Beaver, Alaska. Washington, D.C. Oct. 1957. 6 p., text map. (U.S. Geological Survey. Reports, open file series, no. 433.) 4 refs.

Reports investigation June 12–13, 1957, for the Alaska Rural Development Board, to determine if erosion threatened this village (66°22′ N. 147°30′ W.) and to locate a ground-water supply at the proposed new site. Physical setting of the village, the meandering Yukon River, and evidences of permafrost are briefly noted. Several factors tend to accelerate the bank erosion: character of the bank material, direction and volume of current, scarcity of binding vegetation, change in the river channel. Villagers have chosen a new site a short distance downstream. Water supply from wells along the riverbank is suggested.

55931. WALLERSTEIN, GEORGE, *and* **D. CLARKE.** Mountains of the midnight sun. (Pacific discovery. May–June 1958. v. 11, no. 3, p. 4–11, illus.)

Describes experiences, summer 1957, of a six-man party of mountaineers in the unmapped northeast corner of the St. Elias Range, Canadian Yukon. From a base camp near Mt. Wood (61°11′ N. 140°31′ W.) glaciological studies were made, and mountains climbed, six for the first time. Heights of the summits and names suggested for them by the group are Snowfield, 13,400 ft.; Mt. Fermi, 13,800 ft.; South Gemini, 11,500–12,000 ft.; Angeles, 12,000 ft.; Avalanche, over 10,000 ft.; and two other approx. 10,000 ft. peaks. Snow samples were taken for study at the California Institute of Technology; information obtained from them may provide a new method of dating snow layers. ***Copy seen:*** DGS.

55932. WALLERSTEIN, GEORGE. Movement observations on the Greenland ice cap. Wilmette, Ill., Aug. 1957. 4 p., text map, 2 tables. (*In:* U.S. Army. Corps of Engineers. Greenland ice cap research program, 1955–56, v. 2. SIPRE special report 24.) 5 refs.

Describes, with summary table, relocation of 14 of 19 possible accumulation stakes, on the trail of the Expéditions polaires françaises 1951 from Central Station 190 miles westward. Observations were part of Project "Jello" 1955. Additional stakes were placed in 1955 to facilitate further work. Location of stakes in 1951 and 1955, estimated error, amount and direction of movement are tabulated. Map shows route, and indicates stations. ***Copy seen:*** CaMAI.

55933. WALLIN, BROR. Resa i Norrland. (Beten, vallar, mossar, Oct. 1952. årg. 4, nr. 8, p. 99–107, 18 illus.) Text in Swedish. ***Title tr.:*** Journey in Norrland.

A summer trip through Swedish Lapland from south to north, to Karesuando, and southward along the Torne valley to Haparanda and the coast, is described from an agriculturalist's viewpoint. Low growing-temperatures, decrease in forest pasturage, emphasis on good farming practices, and the general well-being of low-arctic agriculture are noted. At Övertorneå (66°22′ N. 23°40′ E.), tomatoes, cucumbers, melons, and even fruit trees are grown at a large greenhouse, in part for the Stockholm market.

Copy seen: DLC.

55934. WALLIN, THURE. Återväxtproblem i Norrland. (Skogen, *Stockholm,* Apr. 1, 1955. årg. 42, nr. 7, p. 130–131, +) Text in Swedish. ***Title tr.:*** Regeneration problems in Norrland.

Recommends measures for regeneration following clear-cutting in Norrland pine forests: 20-hectare cutting areas are the most economic; the site should be completely cleared (including aspen, birch, etc.) and burned over. Planting, though it requires more seed, yields better results than sowing; plantings should be watched and controlled.

55935. WALLSTRÖM, SIGVARD. Studier i övre Norrlands språkgeografi med utgångspunkt från Arjeplogmålet. Uppsala, Almqvist & Wiksells boktr., 1943. x, 162 p., 16 maps, table. 127 refs. Text in Swedish. ***Title tr.:*** Studies in the speech geography of upper Norrland with the Arjeplog dialect as point of departure.

Speech differences in northernmost Sweden are analyzed with reference to Arjeplog (66°04′ N. 18° E.), first Lappish community penetrated (about 1635) by Swedes, mining silver at nearby Nasafjäll. Individual words are analyzed on the basis of phonology, distribution, significance or meaning, and syntax. Relationships are established between the Arjeplog dialect and those of the Ume, Pite, and Skellefte river valleys of northern Sweden, also that of Ångermanland in southern Sweden whence the earliest colonists migrated, and of Nordland in Norway. While the colonists were relatively few, Lappish was the common language, but Swedish is now spoken almost exclusively. Influences of Lappish are traced in phonology and borrowed words; 63 words are individually discussed and differences in 16 are mapped according to phonology in upper Norrland. ***Copy seen:*** DLC.

55940. WARD, RICHARD T. Some ecological notes on the alpine tundra in the area of the Juneau Ice Field. (Iowa Academy of Science. Proceedings, 1957. v. 64, p. 113–26, illus., map.) Condensation of M.A. thesis to Univ. of Minnesota 1951.

A study of major plant species on several nunataks and related areas of the Juneau Ice Field, made during the summer of 1949. The meteorological conditions were recorded and compared with other years. The time and manner of nunatak invasion are analyzed. Under present conditions it is very difficult,

except for a few species fitted for long-distance travel by wind; animals are negligible as transport agents. A major invasion probably took place during the Xerothermic period. ***Copy seen:*** DGS.

55949. WATSON, ADAM. The behavior, breeding, and food-ecology of the snowy owl *Nyctea scandiaca*. (Ibis, July 1, 1957. v. 99, no. 3, p. 419–62, illus., 8 diagr.) 84 refs.

Contains results of field work May–Sept. in the Penny Highland of Cumberland Peninsula, with the 1953 Baffin Island Expedition. Observations on behavior, registered flight and hunting, behavior to other snowy owls, reaction to man, displacement activities, preening, eating, nest sanitation and behavior of the young. The owls were confined to a wet lowland area where lemmings were abundant and nests were in prominent position. Egg laying started in the third week of May; mean clutch was eight eggs. The egg hatched at different dates; most young left the nest in their fourth week. Proportionate changes in weight (diagr. 2–3) were greatest in the first few days; young ate about two full-grown lemmings a day while in the nest; adults ate three to five a day. The relation of changes in lemming population to predation by owls is discussed. ***Copy seen:*** DSI.

55950. WATSON, ADAM. Birds in Cumberland Peninsula, Baffin Island. (Canadian field - naturalist, July – Sept. 1957. v. 71, no. 3, p. 87–109, text map, 6 tables.) 57 refs.

Contains an annotated list of 32 species of birds studied during May–Sept. 1953 on the P. D. Baird Expedition. Islands and fjords on the Davis Strait coast of the Peninsula were visited by sledge in May, and most of the summer was spent in a mountain valley of Penny Highland. At the big fulmar (*Fulmarus glacialis*) colony on Cape Searle, not more than 25,000 fulmars were in occupation of the cliffs, at the end of May; their body weight is less than in Atlantic birds (tables 1–3). Breeding success of Lapland longspur and snow bunting, and their measurements are tabulated. The food contents of snow bunting, Lapland longspur, horned lark and rock ptarmigan are analyzed in appendix. ***Copy seen:*** DLC.

55951. WATSON, ALEXANDER. D.O.T. has large expansion program. (Canadian shipping, Dec. 1957. v. 29, no. 3, p. 80–81, illus.)

Lists, with brief descriptions, four Canadian Dept. of Transport ships delivered in 1957, and nine ice-breakers, work boats, supply and buoy vessels under construction, the majority for arctic service. Another seven ships are under design. All vessels over 150 ft. in length have helicopter platforms.

55952. WATTS, MURRAY. Operating conditions in Ungava. (Precambrian, Sept. 1957. v. 30, no. 9, p. 22–26, 2 illus., port.)

Describes recent nickel-copper discoveries in the Cape Smith-Wakeham Bay area, an east-west belt of older Precambrian rocks about 200 mi. long and 30 mi. wide across northern Ungava Peninsula. Sulfide zones observed by writer in 1931–1932, were explored in 1955. An east-west belt of pillow lavas forms a range of hills across the peninsula. South of the hills are narrow interbedded lavas and sedimentary rocks intruded by sills or dikes of gabbro-diorite type with associated sulfide occurrences; outcrops are plentiful. Accessibility is conditioned by the climate: short summer season (July–Aug.), early freeze-up (Oct.), and winter snowfall of 3–4 ft. affording good transport; and by the rugged terrain with shallow rivers and numerous lakes. Best travel is by bombardier tractor with trailer in summer, and by sleds in winter. Exploration and prospecting costs (high), sea ports and supply bases are considered, also need for aircraft, labor supply, power sources, possible European markets. ***Copy seen:*** DGS.

55953. WATTS, MURRAY. Prospecting in Ungava. (Canadian mining journal, Apr. 1958. v. 79, no. 4, p. 96–97.) Paper read at 26th annual convention of (Canadian) Prospectors and Developers Association, 1958.

Describes known mineral resources of East Hudson Bay-Ungava Bay area; also problems and pressing needs in development: transportation, communications, population, etc.; additional knowledge of climate, topography, geology. Current mineral production and planning is described. ***Copy seen:*** DGS.

55954. WATTS, NOEL. Narvik. (Norseman, Sept.–Oct. 1958. v. 16, no. 5, p. 308–310, illus.)

Describes the iron ore port in northwest Norway. The modern town of 12,000 inhabitants was rebuilt after World War II. Ore (30,000–40,000 tons daily) arrives by electric train from Swedish mines, and is loaded on ships, 4,500 tons/hr., by mechanized methods. Plans for expansion are noted.

55963. WEEKS, WILFORD FRANK, *and* **D. L. ANDERSON.** An experimental study of strength of young sea ice. (American Geophysical Union. Transactions, Aug. 1958. v. 39, no. 4, p. 641–47, table, diagrs., graph.) 10 refs.

Describes in-place cantilever beam tests of homogeneous sheet ice, made in North Star Bugt (76°33′ N. 68°52′ W.), North Greenland, and at Hopedale, Labrador. A definite relationship was found between flexural strength and brine content. Experimentally determined values of Young's modulus are used to calculate the ice thickness required to support light loads; the calculations are compared with field (Thule) observations. The bearing capacity of a sea-ice sheet is dependent on the brine content; thin ice sheets are capable of supporting a large "super load" beyond the force necessary to form the first crack. ***Copy seen:*** DLC.

55964. WEEKS, WILFORD FRANK, *and* **O. S. LEE.** Observations on the physical properties of sea-ice at Hopedale, Labrador. (Arctic, 1958. v. 11, no. 3, p. 135–55, map, illus., diagrs., graphs.) 13 refs.

Preliminary results are reported of field studies 1955–56 by the U.S. Air Force Cambridge Research Center, the Hydrographic Office and SIPRE on the general physical properties of sea ice; methods of measurement are described. Characteristics of sea water during the freezing period are outlined: formation, structure, and salinity of the initial ice cover, formation and characteristics of infiltrated snow-ice, growth of the ice and influencing factors, density of the ice at various periods, and crack formation are discussed. Data on the salinity of sea ice formed during wave action and that of sheet-ice, hourly averages of air and ice temperatures at various levels, snow and slush density and thickness, observed slush levels and theoretical water levels are shown. Salinity of ice before and after the slush layer froze, and that of deteriorating ice, salinity of ice vs. ice thickness, thickness of the ice versus degree-days, the density of the ice, and measured ice densities vs. theoretical density of air-free sea ice at −15° C. are figured and discussed. The orientation of sea ice *c*-axes and of infiltrated snow-ice *c*-axes are diagrammed.—From SIPRE. ***Copy seen:*** CaMAI.

55965. WEEKS, WILFORD FRANK, *and* **D. L. ANDERSON.** Sea ice thrust structures. (Journal of glaciology, Mar. 1958. v. 3, no. 23, p. 173–75, illus., diagr.) Ref.

The structures, consisting of a series of parallel, rectilinear overthrusts alternating with similarly shaped underthrusts, were observed in open leads at the edge of fast ice at Hopedale, Labrador and during initial freezing of Wolstenholme Fjord, northwest Greenland. Similar structures were observed during flights over the Beaufort Sea in 1951. The phenomenon occurred in areas of ex-

tremely thin sheet ice (2–6 cm.) and varied in dimensions from 0.1 x 1 m. to 40 x 100 m., the corner angles usually 90°, occasionally as low as 70°, the maximum dimension of the thrust sheets usually normal to the initial ice edge and parallel to the wind at the time of formation. The phenomenon is attributable to the splitting of a thin, homogeneous sheet of ice under the combined action of wind, tide, and waves, and the consequent deposition of individual segments on top of shore-fast ice by the crest of a wave. When the wave crest passes, the overlapping part of the deposited sheet collapses and slides under the fast ice during the next wave trough. When thicker ice is subjected to these same forces, pressure ridges result.—From SIPRE. ***Copy seen:*** DGS.

55966. WEEKS, WILFORD FRANK. The structure of sea ice: a progress report. (*In:* Arctic Sea Ice Conference. Proceedings, 1958. p. 96–98.) 6 refs.

Based upon field study during winters 1956/57 and 1957/58, of the general crystalline structure of the sea ice along the coasts of northern Labrador, Baffin Island, and northwest Greenland. The freezing process in sea water is discussed in detail, noting shape, size, alignment and optical characteristics of crystals; consolidation of crystals into skim ice; thermal conductivity at various depths. Freezing of sea and lake ice is compared. ***Copy seen:*** DN–HO.

55967. WEERTMAN, J. Deformation of floating ice shelves. (Journal of glaciology, Mar. 1957. v. 3, no. 21, p. 38–42, diagr.) 8 refs.

The problem of the creep deformation of floating ice shelves is solved, using Glen's creep law for ice and Nye's relation of steady-state creep (the analogue of the Lévy-Mises relation in plasticity theory). Good agreement is obtained between an observed creep rate at Maudheim in the Antarctic and that predicted from the results of creep tests made by Glen.—From author's abstract. ***Copy seen:*** DGS.

55968. WEERTMAN, J. On the sliding of glaciers. (Journal of glaciology, Mar. 1957. v. 3, no. 21, p. 33–38, 2 diagrs., graph.) 9 refs.

Sliding over its bed may contribute to a glacier's surface movement. About 80% of the movement of Highway Glacier, Penny Ice Cap, Baffin Island, is due to sliding (No. 43245). Examples from Switzerland and Norway are also noted. "A model is proposed to explain the sliding of any glacier whose bottom surface is at the pressure melting point. Two mechanisms are considered. One is pressure melting and the other is creep rate enhancement through stress concentrations. Neither of the mechanisms operating alone is sufficient to explain sliding. If both mechanisms operate together appreciable sliding can occur." ***Copy seen:*** DGS.

55971. WEIDICK, ANKER. Gletscheraendringer i Grønland og Europa i historisk tid. (Grønland, Apr. 1958, nr. 4, p. 137–45, illus., diagrs.) Text in Danish. ***Title tr.:*** Glacier changes in Greenland and Europe in historical time.

Contains a general account of accumulation and ablation processes in glaciers and periods of their advance and recession in Europe. Details are given on the development of Greenland glaciers. Reports date from about 1750, but during the Norse period (approx. 1000–1500) the climate was mild. The glaciers probably started advancing, as in Europe, about 1600, and in 1750, were in a very advanced or advancing position. Most Greenland glaciers present this pattern: maximum extension about 1750, recession, interrupted by delays and advances around 1800, 1850 and 1890 and a speedy recession after about 1900. A diagram represents the recession of eight of them.

Some of the North Greenland glaciers have started advancing in the last few years. ***Copy seen:*** DLC.

55972. WEILER, GLADYS D. Alaska begins operation of own mental health program. (Alaska's health, Oct. 1957. v. 14, p. 1–2.)

Contains information on the Alaska Mental Health Act of the U.S. Congress (Public Law 830, July 28, 1956) and the Territorial Mental Health Commitment Act (CH. 87, SLA 1957), and their outstanding features; the planned construction program, staff recruitment, mentally retarded patients, rehabilitation, etc. ***Copy seen:*** DNLM.

55986. WELLS, JOSEPH VAN BRUNT, *and* S. K. LOVE. Compilation of records of quantity and quality of surface waters of Alaska through September 1950. Washington, D.C., U.S. Govt. Print. Off., 1957. 5, 262 p., fold. map, diagrs., tables. (U.S. Geological Survey. Water-supply paper 1372.) 3 refs.

Comprehensive summary of published stream-flow records for Alaska prior to 1946, compiled on a monthly and yearly basis. Published for the first time are: records of daily and monthly discharge and miscellaneous discharge data, collected 1946–50; also results of quality-of-water testing. A general description of Alaskan surface-water records is given, including the stream-gaging program, principal features of the data, material previously published, hydrologic conditions; comparable information on the quality-of-water records is also provided. A bar chart summarizes some of the data presented in the body of the report. Records from 262 stations (cf. map) are presented in two sections: Southeast Alaska, and area west of 141° W. Miscellaneous discharge measurements and chemical analyses supplement the station records. ***Copy seen:*** DGS.

55987. WELLS, JOSEPH VAN BRUNT, *and* S. K. LOVE. Quantity and quality of surface waters of Alaska, October 1950 to September 1953. Washington, D.C., U.S. Govt. Print. Off., 1958. vi, 243 p. tables. (U.S. Geological Survey. Water-supply paper 1466.) Refs.

Contains data on the flow and the chemical and physical quality of streams in Alaska, based on records from 64 gaging stations, 175 chemical sampling sites and from 11 sediment measuring stations during the three-year period. Terms, methods of gaging and analysis, etc. are explained. Comparison is made between field data (runoff) and computed results (precipitation). Base data collected at gaging stations consist of records of stage and measurements of discharge; factors affecting the stage-discharge relationship, weather records, and other pertinent information are also included. The report is in two sections: Southeast Alaska, and area west of 141° W.

Boxes of books will be sent out to the trading stations. Children's libraries are to be set up in 16 towns. Guiding principles for book purchase are outlined. ***Copy seen:*** DLC.

55998. WESTERMARCK, NILS. Die finnische Landwirtschaft. Helsinki, Gesellschaft Pellervo, 1956. 87 p. 41 illus. on 31 plates, 16 text maps, 7 diagrs., 5 tables. 20 refs. Text in German. ***Title tr.:*** Finnish agriculture.

Finland is the fifth largest country in Europe with population second lowest per unit area; 8% of its area was farmland in 1950 and 71% was forested. The importance of forestry in the national economy and to the farmer is stressed. The natural background, historical development, and present conditions of agriculture are concisely presented. Since Finland became independent, land use has changed from self sufficiency to an intensive, integrated, commercial economy. This is due to land reforms, clearing of new land, agricultural subsidies and premiums, also to improvements in crops and farming practices, development of the export market, and to education, as well as individual and cooperative effort. Data, including comparative production figures over the past half century, are presented for each important agricultural crop. Cooperatives, their development and present status, are individually discussed. Education, practical training, and professional guidance are considered in detail and agricultural administration is outlined in tabular form. A third of the linear extent of the country is in the arctic region. Its agricultural conditions, activities, and products are representatively included in this study. ***Copy seen:*** DLC.

55999. *WESTERN MINER AND OIL REVIEW.* Canadian Arctic survey. (Western miner and oil review, Oct. 1958. v. 31, no. 10, p. 114–15, map.)

Outlines federal surveying program of 50,000 sq. mi. of the Canadian Arctic Islands, made by Aero Surveys (western part), Spartan Air Services (central), and The Photographic Survey Corp. (eastern part). Two B–17's fitted with Airborne Profile Recorder and fuel tanks for 15 hrs. of flying, photographed 31,000 sq. mi. in the (July–Aug.) 1958 season. The photography will be used for delineating navigable waters, and is the first step in providing base mapping, essential for the recording of further geological information. ***Copy seen:*** DI.

56005. WETHERBEE, DAVID KENNETH. Natal plumage and downy pteryloses of passerine birds of North America. (American Museum of Natural History, New York. Bulletin, 1957. v. 113, article 5, p. 343–436, 13 illus., plates 6–7, 90 tables.) 190 refs. M.A. thesis to Clark University.

Birds are best known by their plumage and the various plumages of most North American birds have been described. The natal plumage, and the downy feather growth pattern of the Passeriformes, the most numerous order of birds are described, with measurements (in mm.) and counts of downy feathers of various species presented in tables. *Parus rufescens*, the chestnut-backed chickadee, from Yakutat in Alaska, and *Calcarius lapponicus*, the Lapland longspur, from Northwest Territories, are included. Reduction of the natal plumage, considered a product of specialization, is suggested to be a by-product of total embryonic specialization. Complete loss of the natal plumage has occurred in some families. Because of its fragility, most individual variations observed in this plumage are due to abrasion rather than to genetic differences. Statistical treatment of two species showed the positive value of natal pterylosis as a tool in systematics even with small samples. ***Copy seen:*** DLC.

56006. WETTERN, DESMOND. Japan in the Antarctic. (Nautical magazine, Apr. 1957. v. 177, no. 4, p. 231.)

Contains brief description of the icebreaker-supply ship *Soya* used by the Japanese research team participating in the IGY. The 2,600-ton vessel has been specially strengthened and fitted with heeling and trimming tanks. It is powered by two diesel engines, is 79 m. long with a 15 m. beam, and cruises at 12.5 knots. The ship carries modern scientific equipment as well as a seaplane and helicopter. ***Copy seen:*** DLC.

56007. WEVER, RÜTGER, *and* **J. ASCHOFF.** Die Wärmedurchgangszahl als Durchblutungsmass am Menschen. (Pflügers Archiv für die gesamte Physiologie, 1957. Bd. 264, Heft 3, p. 272–79, illus.) 5 refs. Text in German. ***Title tr.:*** "Heat transit number" as measure of circulation in man.

Description of a method evolved from observations on a model and on human fingers. It enables to determine the heat current at the body surface, the temperature difference between core and surface and the quotient of both values: the heat transit number.

56008. WEXLER, HARRY, 1911– . Modifying weather on a large scale. (Science, Oct. 31, 1958. v. 128, no. 3331, p. 1059–1063, 3 graphs, 3 tables.) 19 refs.

Discusses feasibility and probable results of two proposals for large scale modification of Northern Hemisphere weather: (1) changing the albedo or reflectivity of a large area by blackening the surface of the arctic ice pack to in-

crease the melting of the surface, and enlarge the water-covered area of the arctic ocean, with resulting changes in temperature and humidity; (2) reducing the return of infrared radiation to space, by such means as formation of ice clouds from nuclear explosions under the arctic ocean; these ice clouds would greatly increase surface temperatures and speed current melting of the ice pack; but would also increase snowfall along the arctic coasts. ***Copy seen:*** DLC.

56009. WEXLER, HARRY, 1911– , *and* W. B. MORELAND. Winds and temperatures in the arctic stratosphere. (*In:* Polar Atmosphere Symposium, Oslo 1956. v. 1, *pub.* 1958, p. 71–84, 3 fold. maps, graphs.) 23 refs.

General characteristics of the temperature and wind fields at 50 mb. in the Arctic are described and compared with upper-air conditions in the Antarctic. Studies revealed the existence of cold cyclones and warm anticyclones which have little or no connection with lower-level systems. These findings have explained some of the confusion arising from earlier observations and have also led to a better understanding of the smaller-scale dynamic structure of the wind and temperature fields. The arctic stratosphere in winter appears to be 5°–10° C. warmer than at equivalent latitudes in the Antarctic; summer temperatures are more nearly equal. There is also evidence of a strong winter jet stream near 30 km. at the boundary between the dark and sunlit stratosphere. ***Copy seen:*** DLC.

56011. WHEELER, EVERETT PEPPERRELL, 1900– . Pleistocene glaciation in northern Labrador. (Geological Society of America. Bulletin, Mar. 1958. v. 69, no. 3, p. 343–44.) 5 refs.

Examines R. F. Flint's theory that the Kighlakhpait (Kiglapait) and Khaumayet (Kaumajet) Mts. on the northern Labrador coast were important ice-cap centers during the waning phases of the Laurentide Ice Sheet (cf. No. 21848). Observations of indicator erratics, direction of striations, drumlins and drumlinoids, and summit elevations showed no evidence to support the theory. They indicated, instead, that the only important Pleistocene ice movement of which any trace remains was from south of west. This is in accordance with the theory of Douglas and Drummond (cf. No. 28804) that there was a center of glaciation in the Knob Lake region. ***Copy seen:*** DGS.

56012. WHEELER, JOHN OLIVER. Mesozoic tectonics of northwestern Canadian Cordillera. (Pacific Science Congress. 9th, *Bangkok, Thailand,* 1957. Abstracts of papers, p. 115.)

56018. WHITHAM, KENNETH, 1927– , *and* E. I. LOOMER. Characteristics of magnetic disturbance at the Canadian arctic observatories: part I, cyclic field changes on quiet and disturbed days; part II, transient field changes. Ottawa. Queen's Printer, 1957. p. 289–346, 22 diagrs., 11 tables. (Ottawa. Dominion Observatory. Publications, v. 18, no. 12.) 48 refs.

Part I: Three classes of days at Resolute Bay (geomagnetic latitude 83° N.) and Baker Lake (geomagnetic latitude 73.7° N.) are selected, corresponding to "local disturbed," "local quiet," and "local very quiet" conditions at a time of sunspot minimum. The disturbance daily variation is harmonically analyzed, and the statistical properties of the cyclic disturbance waves examined. Well inside the polar cap, the form of the disturbance field remains substantially constant, independent of the intensity of disturbance and the season. In the transitional region north of the auroral zone, diurnal disturbance is much more complex and variable. Part II: The analysis of magnetic disturbance at Resolute Bay and Baker Lake is extended to include sudden commencements, sudden commencement storms, non-sudden commencement storms, and bay phenomena. The physical meaning of the mean disturbance field and non-cyclic changes is also discussed; a number of new results are suggested by these analyses.—From authors' abstract.

56019. WHITHAM, KENNETH, 1927– , *and* E. I. LOOMER. Irregular magnetic activity in northern Canada with special reference to aeromagnetic survey problems. (Geophysics, July 1957. v. 22, no. 3, p. 646–59, 6 diagrs.) 5 refs.

Investigation of the diurnal and seasonal characteristics of irregular magnetic activity in northern Canada, using the indices of disturbance, shows that, in general, the K index provides a reliable but smoothed measure of short period activity. Two peaks of activity exist, a day-time peak, dominant inside the polar cap, and a night peak, dominant south of the auroral zone. Measurements of range at the most disturbed observatory suggest that aeromagnetic surveying in high latitudes is in general feasible, but that for accurate reconnaissance work it is advantageous to plan operations, taking account of the systematic diurnal variation of disturbance. The location of the magnetic observatories (including those for IGY) and the approximate location of the auroral zone in Canada are mapped. The diurnal and seasonal variations in the usual K index are graphed for Meanook, Baker Lake, and Resolute. A special index is evolved to measure disturbances with periods or other characteristic times of less than 15 minutes. ***Copy seen:*** DLC.

Report on Norwegian fishery and marine investigations, 1957. v. 11, no. 8, p. 3–24, illus., tables, map.) 36 refs.

A study on the occurrence of cod eggs and larvae in the waters of northern Norway during 1948–56 and of biological and physical factors possibly influencing the size of year classes in the catch. No correlation was found between abundance of eggs and larvae and the corresponding year classes. No increased mortality was found at any stage of early life. The factors responsible for rich year classes are discussed. ***Copy seen:*** DI.

56022. WIBORG, KRISTIAN FREDRIK, 1914– . Forekomst av fiskeegg og- yngel i nordnorske farvann våren 1952 og 53. Fiskets gang, Jan. 7, 1954. årg. 40, nr. 1, p. 5–9, 12 maps, graph.) Text in Norwegian. ***Title tr.:*** Occurrence of fish eggs and young in north Norwegian waters in the spring of 1952 and 53.

Variations in fish hatches were studied in Vestfjord, Andfjord, and on coastal banks northward to Nordkapp. Samples were taken to 75 m. depth (with plankton collectors) and the hatch per sq. m. of sea surface computed. Cod eggs and hatch for several periods are mapped and annual differences for the period 1947–1953 diagrammed. The large hatch of 1949 may appear in the catch off Finnmark and in Barents Sea if comparison between numbers of young and age classes is valid. Herring, haddock and several small local varieties were also studied. Annual variations in location and limits of spawning grounds, which depend on hydrographic conditions, may be determined. ***Copy seen:*** DLC.

56050. *WILLGOHS, JOHAN FREDRIK, 1915– . Some notes on *Beryx decadactylus* (Cuv. & Val.) in European waters with a special account of Norwegian records. Bergen, Grieg, 1957. 13 p. illus., map, table. (Bergen, Norway. Universitetet. Årbok 1956, naturvitenskapelig rekke, no. 15.) 14 refs.

Discusses captures (32) of this rare fish in Norwegian coastal waters 1839–1955, including seven in the Andøy area (69° – 69°30′ N.). Most, but not all, were taken in deep waters (to 400 fathoms) and most since 1920. Distribution and frequency of the Norwegian (also Icelandic) finds seem not accidental; it represents a considerable extension of range into regions influenced by warm Atlantic drift. Tabulated data on finds include museum locations of specimens, measurements, fin rays, sex glands, etc.

56052. WILLIAMS, GAYNOR PARRY, *and* **L. W. GOLD.** Snow density and climate. Ottawa, July 1958. 4 p., map, diagr., tables. (National Research Council of Canada. Division of Building Research. Research paper no. 60.) 16 refs. Reprinted from Engineering Institute of Canada, Transactions, May 1958. v. 2, no. 2, p. 91–94.

Data on snow density collected since 1947 from selected stations across Canada (including Aklavik, Churchill, Goose Bay, Moosonee, Resolute, and Whitehorse), are summarized and discussed in relation to meteorological variables, particularly wind velocity and air temperature. Higher densities (except in mountainous regions) are usually associated with shallow snow covers and extreme wind and temperature conditions. The insulating value of the snow cover is given for different regions of Canada, and its effectiveness noted in forest regions. Values of thermal conductivity in exposed locations such as on the prairies, in the Arctic, or on high mountains are much higher than in sheltered areas.

56053. WILLIAMS, GAYNOR PARRY. Variability of physical characteristics of snow cover across Canada. (*In:* International Union of Geodesy and Geophysics. Association of Scientific Hydrology. Report, 1957. v. 4, *pub.* 1958, p. 158–65, text map, 3 diagrs., table.) 4 refs.

Summarizes results of snow-cover sur-

vey obtained subsequent to those reported by Klein (No. 8805) and by Pearce and Gold (No. 25010). Observation stations (map) include Resolute, Aklavik and Gander; data used and method of analysis are discussed; variations of density, hardness and grain-size are briefly described and shown graphically. Greatest extremes in hardness were recorded at Resolute and Aklavik. Probability values of extremes for these snow characteristics are also depicted graphically. Development of the "Canadian snow kit" (instruments used) is noted. ***Copy seen:*** DGS.

56054. WILLIAMS, GEORGE C. A cold wave strikes interior Alaska. (Weatherwise, Oct. 1958. v. 11, no. 5, p. 164–65, +, graph, 2 text maps.)

Describes situation on Jan. 22–25, 1953, when passage of a secondary arctic front caused temperatures in the Tanana valley to fall to the −50's, with an extreme low of −58° F. at Tanana village. The short life of this cold snap was unusual, but it provided evidence of the existence of secondary arctic fronts in Alaska in winter. ***Copy seen:*** DWB.

56055. WILLIAMS, HOWEL, 1898– . *and others.* Landscapes of Alaska, their geologic evolution. Berkeley and Los Angeles, University of California Press, 1958. 12, 148 p., illus., 8 maps incl. 7 fold., diagr., tables. (U.S. National Park Service. Recreation Survey of Alaska, pt. 4, v. 1, Geology and Geography.)

Contains 16 chapters prepared by specialists for the general reader. Introduction by J. C. Reed and H. Williams (p. 1–8) outlines the geologic development of the landscapes, which are then described for each of the 15 regions, viz:

Southeastern Alaska, by J. C. Reed (p. 9–18), its wildlife, ethnic groups, principal landscape characteristics and their geologic unfolding;

Gulf of Alaska area, by D. J. Miller (p. 19–29), its glaciers, and contrasts in topography, vegetation and climate;

Wrangell Mountains, by R. F. Black (p. 30–33), isolated, and largely covered with snow and ice.

Copper River plateau, by R. F. Black (p. 34–37), has much evidence of glaciation and permafrost, is crossed by several highways;

Talkeetna Mountains, by F. F. Barnes (p. 38–42), rugged, show evidence of numerous geologic processes, mineral deposits of value;

Cook Inlet-Susitna lowland, by F. F. Barnes (p. 43–47), its Matanuska valley, bituminous coal deposits, changes effected by glaciation;

The Alaska Range, by C. A. Wahrhaftig (p. 48–60), 600-mile-long mountain wall, featuring Mt. McKinley;

Alaska Peninsula-Aleutian Islands, by H. A. Powers (p. 61–75), volcanic belt extending from Anchorage to Attu;

Lowlands and plains of interior and western Alaska, by R. F. Black (p. 76–81), scattered but similar in topography, show climatic and glacial fluctuations, evidence of permafrost;

Interior highlands of western Alaska, by J. M. Hoare (p. 82–87), noted for mining of gold, platinum, mercury, tungsten;

Interior highlands of eastern Alaska, by R. M. Chapman (p. 88–103), have varied landscape, mineral wealth, hydro-electric power resources and good transport facilities, but permafrost restricts construction;

Seward Peninsula, by J. P. and D. M. Hopkins (p. 104–110), with extensive uplands and rugged mountains, possibly the bridge for migration from Asia to North America;

Brooks Range, by G. Gryc (p. 111–18), rugged, glaciated, treeless wilderness;

Arctic Slope, by G. Gryc (p. 119–27), frozen tundra, almost uninhabited, with bars and islands off the low coast;

Islands of the Bering Sea, by G. M. Flint (p. 128–36), St. Lawrence, St. Matthew, the Pribilofs, Nelson, and Nunivak. Photographs by H. B. Washburn and others, and color maps by R. L. Moravetz add to usefulness of the volume. ***Copy seen:*** DLC.

56056. WILLIAMS, JAMES A. Minerals in Alaska. (Western miner and oil review, Oct. 1958. v. 31, no. 10, p. 140, +, illus.)

Surveys present prospecting activities stating names of companies, area of search, and state of development. Search is now mainly for iron, copper, coal, and oil; to a lesser extent, nickel, mercury, uranium, chrome, gold, and molybdenum; 17 companies with 51 helicopters participate in the oil search; leases for more than 30,000 acres have been applied for, mainly in the provinces of Alaska Peninsula-Cook Inlet, Alaska Gulf, Kateel River-lower Koyukuk, and Kandik. A gradual increase in exploration and development activities is expected.

Bulletin, Dec. 1958. v. 69, no. 12, pt. 2, p. 1757.) Abstract of a paper presented at the Ninth Alaskan Science Conference at College, Sept. 3–5, 1958.

Describes past positions, indicated by moraines and marginal channels, of this glacier which (according to photographs) has had only minor horizontal retreat but considerable thinning since 1898. The glacier filled the Matanuska valley, terminating between Anchorage and Willow, during Wisconsin time. It stagnated in the lower valley, but readvanced more than 8,000 years ago in the upper valley to positions 2½–5 miles from the present, blocking Caribou and Glacier creeks and the upper Matanuska River. This readvance was followed by retreat and canyon cutting. Moraines, probably formed in the last 4,000 years, occur in the valley bottom 1, ¼, and within ¼ mile west of the terminus. An advance prior to 1898 is recorded by unvegetated moraines marginal to the ice.

Survey of coal reserves in western Canada, as of 1956; present and possible future use in industry, thermal power production, railways, and domestic heating. Table and map of reserves show small supplies of mineable coal in Yukon and Northwest Territories (5% of total for area), mostly lignite and subbituminous. ***Copy seen:*** DGS.

56059. WILLIAMS, MORGAN L. Brittle fractures in ship plates. (U.S. National Bureau of Standards. Circular, May 7, 1952. no. 520, p. 180–206, illus., diagrs., graphs, table.) 12 refs.

Data were obtained by Charpy V-notch bar tests of 113 plates removed from fractured ships and examined at the National Bureau of Standards. The probability of fracture development in a plate increases markedly with increased notch sensitivity of the steel, as measured by the 15 ft. pound transition temperature of Charpy V-notch specimens. The notch sensitivity is increased with increasing amounts of carbon and phosphorus, and decreased with finer grain size and with increasing amounts of silicon and manganese. ***Copy seen:*** DI.

Preliminary analysis of the progression of large synoptic systems (sea-level) by computing a persistence function. Generally high stability prevailed throughout the year; high persistence was maintained during periods of six days average, alternating with abrupt large-scale reorganizations. A winter-spring regime, with consistently high degree of persistence maintained for 14-15 days, was followed by a June change to a summer-autumn regime, with less stable conditions and less distinct changes; then a gradual return to winter conditions. Sudden increases in geomagnetic activity were followed in 14 days by a marked decrease in the persistence function. Tables, graphs, and maps summarize the results. ***Copy seen:*** CaMAI.

56075. WILSON, H. P., *and* **W. E. MARKHAM.** A study of arctic surface winds. Ottawa, May 13, 1957. 13 p. mimeo., 8 tables. (Canada, Dept. of Transport. Meteorological Branch. Circular-2923, Tec.–251.) Ref.

Study undertaken to aid forecasting of surface winds for the five joint Ca-

nadian-American weather stations in the Queen Elizabeth Islands; viz: Resolute, Eureka, Alert, Mould Bay, and Isachsen; also to elucidate the relationship between winds at the surface and at gradient levels. Three-hourly observations, June 1949–June 1954, and twice-daily upper wind observations at Alert, Eureka and Resolute, 1952 and 1953, supplied the data. Surface wind characteristics at all five stations are complex, depending as much upon local air drainage as upon the mean pressure pattern. Stability in the friction layer has considerable influence on surface wind speed and direction; stability and roughness are major factors in the relationship between winds at the surface and at gradient levels. ***Copy seen:*** DWB.

56076. WILSON, J. WARREN. Arctic plant growth. (Advancement of science, June 1957. v. 13, no. 53, p. 383–88.) 34 refs.

Following an introduction on the main physiological and morphological characteristics of arctic plants, the author discusses their annual growth (very slow); summer growth rate; effects of soil fertility and nitrogen shortage; effects of wind on plant temperature and growth. The report is based on observations and experiments on Jan Mayen (71° N. 9° W.) and Cornwallis Island (75° N. 95° W.). The view is advanced that the poverty of arctic vegetation is due immediately, though perhaps not entirely, to the extreme depression of growth rates. ***Copy seen:*** DLC.

56077. WILSON, J. WARREN. Dirt on snow patches. (Journal of ecology, Mar. 1958. v. 46, no. 1, p. 191–98, illus., tables.) 22 refs.

Account of the nature, origin and ecological significance of dirt found on late snow, as studied on Jan Mayen and Cornwallis Islands, with references to the phenomen in Greenland, Finland, etc. Its character was found to vary from wholly mineral to largely organic. It is transported by wind or sometimes by water. Repeated deposition of this dirt builds up a fine organic soil and may contribute nitrogen to the land. It affects the growing season of plants where it retards snow melt.

56078. WILSON, J. WARREN. Observations on the temperatures of arctic plants and their environment. (Journal of ecology, July 1957. v. 45, no. 2, p. 499–531, illus., tables.) 54 refs. "Botanical results no. 4 from the Oxford University Expedition to Jan Mayen 1947, the Jan Mayen Expedition 1950, and the Cornwallis Island Expedition 1954."

A comprehensive study on temperatures of some high-arctic plants and the adjacent air and soil. Most of the observations were carried out at Resolute (75° N. 95° W.). Five species examined showed only minor differences in leaf temperature behavior; hence *Salix arctica* was selected for a representative study. Leaves were found to be warmed by sunshine, commonly for several degrees and even at midnight during "midnight sun"; warming is less, however, than in temperate or tropical regions. During nights, leaf temperatures fall slightly below air temperature. Clouds, mist, wind and shading quickly and greatly reduce the temperature difference between leaf and air. Sunlight markedly raises surface-soil temperature and that of plant clumps and of the air near ground. At night, soil is cooled by radiation, but this cooling is weaker than the day-time warming. Temperature fluctuation in soil and air occur also during the "midnight sun" period. Color, slope, moisture and organic matter may cause significant differences in soil temperature.

56079. WILSON, JAMES LEE, 1920– . Geography of olenid trilobite distribution and its influence on Cambro-Ordovician correlation. (American journal of science, May 1957. v. 255, no. 5, p. 321–40, text map, 2 fold. charts.) 67 refs.

World-wide occurrence of Late Cambrian and Early Ordovician olenid trilobites is plotted. These are a dark-shale-and-limestone fauna widely distributed in the world's orogenic belts or in outcrops between them and major shield areas of the continents. Their distribution is discussed and comparisons made with faunas of the shield areas. Includes faunas of the Yukon-Alaska boundary, Victoria Island in the Canadian Arctic, Novaya Zemlya, Anabar Massif, and Bennett Island (north of Novosibirskiye Ostrova) in northern U.S.S.R. Bearing on stratigraphic problems is noted.

56080. WILSON, JAMES TINLEY, 1914– . Moving loads on floating ice sheets. Ann Arbor, Mich., July 1958. 22

p., illus., 13 diagrs., 2 text maps. (Michigan University. Research Institute. UMRI Project 2432, Final Report under Contract No. AF19(604)–1558, Air Force Cambridge Research Center, Bedford, Mass.) 8 refs. cf. No. 43341.

Develops a simple theory of the coupling between a moving load and the flexural waves generated by it in a floating ice sheet; reports a number of experiments to verify this theory, including measurements of the waves resulting from constant-velocity loads and the waves resulting from aircraft landings and takeoffs. The critical velocity for resonance (coupling) between the moving load and the flexural waves will occur at the *minimum wave velocity for flexural waves* in the ice sheet. This velocity can be predicted reasonably well from a knowledge of the water depth and the ice properties. For a wide range of ice thickness and water depth, this velocity is in the range of ordinary vehicle velocities. The experimental data including those from tests on sea ice on the bay at Hopedale, Labrador, Feb. 1956, indicate that amplitudes at least three times as great as the "static" deflection can result when a vehicle travels at a velocity corresponding to the minimum wave velocity of flexural waves in the ice.—From author's abstract.

Discusses the number of divisions to use in classifying the formations; and the territorial extent over which the Precambrian rock series can be correlated. The division of Precambrian time into more than two eras by means of stratigraphic investigation is not, at present, possible. The geographical sub-provinces delimit the territory to which direct serial correlations can be extended with reasonable certainty.

A combination of circumstances kept the polar pack-ice from receding off the northern coast of Alaska during the 1955 summer. The worst ice year in many years occurred, and over 40 ships had their exit blocked for two weeks at what was normally the height of the shipping season. An unusually deep polar vortex steered the Siberian storms into the western Canadian Archipelago or the Arctic Basin and slowed disintegration of the ice pack. The behavior of the pack's margin under these anomalous meteorological conditions is described, and sample verifications of ice forecasts are given.—From authors' abstract.

56084. WINDBERG, ISAK P. Hur skal det gå med Norrlands jordbruk? (Skogs- och lantbruks-akademien. Tidskrift, 1956, årg. 95, nr. 2–3, p. 100–112, maps.) Text in Swedish. Summary in English. ***Title tr.:*** What is the future of agriculture in Norrland?

Agriculture has economic limitations in large areas of Norrland despite favorable botanical, ecological and biological conditions. Climate limits crops chiefly to frost-resistant forage plants which must be converted to livestock products prior to human consumption. In the interior, small holdings predominate due to topography. Average of crop land, number of farms, and population (excess of births over deaths) are still increasing in Norrland, but decreasing in southern Sweden. Should a significant population movement develop to the south, or to urban areas, Norrland would become a wilderness. National interest indicates development, not decline in this northern province.

Contains brief note on laboratory of the U.S. Army Snow Ice and Permafrost Research Establishment (SIPRE) at Wilmette, Ill.; describes 1957 project which collected ice core samples in summers 1956 and 1957, from a site about 200 mi. east of Thule, at 7,000 ft. elevation. Cores 4 inches in diameter were recovered in a nearly continuous string down to about 1,000 ft.; below that, two 20-ft. strings, the deepest from 1,312 ft. Selected half-cores were studied at the Wilmette laboratory for stratigraphy, character of enclosed air bubbles, porosity and permeability, snow structure, etc. A similar project was carried out in the summer of 1957 at Byrd Station, Antarctica. ***Copy seen:*** DGS.

56088. WISEMAN, JOHN DUGDALE HOLT, *and* **C. D. OVEY.** Proposed names of features on the deep-sea floor. (Deep-sea research, Jan. 1955. v. 2, no. 2, p. 93–106.) 36 refs.

A list of about 65 geographical names prepared by the British National Committee on Ocean Bottom Features is given together with coordinates and depths. Among them are the Aleutian Ridge, Aleutian Basin, and Aleutian and Kuril Trenches. The Aleutian Ridge extends along the Aleutian Island chain from 56° N. 164° E. to Unalaska Island. The Aleutian Basin, located north of the Ridge, showed a maximum corrected depth of 5,236 m. at 53°52′ N. 177°37′ W. The Aleutian Trench is a narrow elongate depression running parallel to the south side of the Kenai and Alaska Peninsulas and the Aleutian archipelago. Maximum uncorrected depth measured was 7,679 m. at 51°13′ N., 174°48′ E. and at 51°49′ N. 172°20′ E. The Kuril Trench runs southwest from Bering Island, parallel to

Kamchatka and the Kurils, terminates near Hokkaido. The *Vitiaz'* record of 10,377 m. depth is noted.

56102. WOOD, C. P., *and* J. J. GLEASON. Weather and flying in Alaska. (Weatherwise, Oct. 1958. v. 11, no. 5, p. 161–63, illus.) 3 refs.

Describes flying conditions: those in the Aleutians are not typical; terminal conditions in Alaska compare favorably with those at several major stateside air terminals. Five regions are characterized: the interior (flying weather unusually good), Gulf of Alaska (better in winter), arctic coast (better with arctic air masses), Bering Sea (rarely good), and Aleutians (one of the worst in the world, especially in summer). Weather hazards (ice fog, ice and snow accumulation, very low temperatures, supercooled fog, and arctic haze) impede operations; but satisfactory air operations can be carried out with knowledge and sound planning.

56119. WREDENFORS, WALTER. Bygge på tjälad jord. (Teknisk tidskrift, Nov. 27, 1956. årg. 86, häfte 44, p. 1021–24, illus., diagrs.) 9 refs. Text in Swedish. ***Title tr.:*** Building on frozen ground.

Describes recent Swedish experiments with winter construction of houses on unexcavated ground, and study of the effects and the physics generally of frost-heaving. Height of the heave is estimated on the basis of soil porosity, capillarity distance from ground water, and time. Ice-lense formation as a function of the soil's grain composition is graphed. Houses built on the ground surface, with a hot-water (40° C.) heating system built into the ground floor to prevent freezing of the soil below, were found too expensive and complicated. Tests are underway of houses on an adjustable concrete-beam base resting on a layer of sand upon the surface of frozen ground. The beams are adjusted once, when the ground becomes frost-free; heat transfer from the house prevents refreezing. ***Copy seen:*** DLC.

A study of changes in excitation and electrical properties at low temperatures in the giant motor axons of the lobster. In particular, threshold values for DC stimulation, chronaxie values and the accommodation time constant were determined as well as repetitive firing, recovery excitability and conduction velocity elucidated. Conduction block occurred at 4°–5° C. in the large non-oscillatory fibers and at 1°–3° in the smaller oscillatory types. Several other problems emerging in low temperature experiments are also discussed. ***Copy seen:*** DNLM.

56121. WRIGHT, GRANT MacLACHLAN, 1917– . Geological notes on eastern District of Mackenzie, Northwest Territories: report and map 17–1956. Ottawa, Queen's Printer, 1957. 23 p., 2 fold. maps. (Canada. Geological Survey. Paper 56–10.) 15 refs.

Contains results of Operation Thelon, geological reconnaissance by helicopter of 61,000 sq. mi. (61°–66° N. 102°–108° W.) in summer 1955. A small area in Keewatin District is included (65°–66° N. 100°–102° W.). Accessibility, topography, vegetation, and wildlife are briefly described; also (by B. C. Craig) glacial geology. Sedimentary and volcanic rocks are Archean and/or Early Proterozoic, Late Proterozoic, and Ordovician. Large parts of the map-area are underlain by Precambrian granitic rocks of wide variety. Several types of basic intrusives are present. Regional trends in granitic gneisses, the Bathurst trench, and possible extension of the McDonald fault into the map-area are discussed. No obviously important mineral deposits were seen, although gossans were found in many places. ***Copy seen:*** DGS.

56122. WRIGHT, J. W., *and* **R. W. KNECHT.** Atlas of ionograms, compiled for the URSI/AGI Special Committee on World-wide Ionospheric Soundings. Boulder, Colorado, Central Radio Propagation Laboratory, National Bureau of Standards, June 1957. v, 7 p. map, chart, and 263 p. ionograms.

The major purposes of the atlas are to illustrate the variability of the undisturbed ionosphere diurnally, seasonally, and geographically; to indicate the schemes for classifying ionospheric characteristics; to illustrate the difficulties encountered in describing ionograms by numerical data; and to give sample ionograms made with the various ionosondes employed today. Section I contains four ionograms on a summer and a winter day at 00, 06, 12, and 18 hours local standard time for the two selected geomagnetically quiet days, July 18 and Nov. 26, 1956. Stations for the higher geomagnetic latitudes include Anchorage, College, and Barrow in Alaska; Churchill, Baker Lake, and Resolute Bay in Canada; Kjeller, Tromsø and Svalbard for Norway; Luleå and Kiruna in Sweden; and

Narsarssuak, Godhavn, and Thule in Greenland. Typical ionograms obtained with American and Canadian equipment are illustrated. Various types of sporadic E are shown with typical ionograms from a number of stations including College, Barrow, Narsarssuak, Tromsø, and Kiruna. Several disturbance effects are illustrated with soundings from Uppsala, Adak, and Kiruna. The stations are listed alphabetically and by geomagnetic latitude. A world map of station locations is included.

delelser om Grønland, bd. 157, nr. 1.) 38 refs.

Reports observations during the British North Greenland Expedition, 1952–1954. Topography, glacial deposits, strand lines and terraces, regional setting and general geology of the area are briefly discussed. Outcrops examined on a 100 km. traverse along Saelsøen and the south coast of Germania Land east to Danmarkshavn are described in detail: field relations, petrography and petrogenesis. Rock types included are schists, paragneisses, granitic gneisses, migmatites, basic and ultra-basic rocks. Mineralogy of the basic and ultrabasic rocks is discussed. Evidence of increasing metamorphism eastward was noted. Rocks exposed in Germania Land were once the roots of the central ranges of the Caledonian mountain chain. ***Copy seen:*** DGS.

Report on a number of observations made at winter temperatures of 10°–12° C. Fall in total heat content was similar to that in Europeans, when exposed to similar temperature. When the African was sleeping under his cloak beside a fire, air temperature over the trunk was at thermal neutrality but extremities were colder. The good use made of fire during the cold periods suggests an intellectual adaptation not a physiological one.

Reports a study made to correlate certain soil properties such as sand equivalent, capillarity, permeability, and frost index number, with the amount of frost heave caused by freezing soils of different textures. The experimental procedure employing prepared soil samples frozen at controlled temperature in a specially constructed cabinet, is described. Frost heave was found negligible when sand equivalent is 60 or more; it increases with decrease in sand equivalent, with silty sand reaching maximum percentage of heave at a higher sand equivalent than clayey sand. The results of the capillarity-permeability test in relation with percentage of frost heave appear linear when plotted on a log-log or semi-log scale. Casagrande's criterion for non-frost susceptible soil appeared valid. Progress was made also in operation of the freezing cabinet. ***Copy seen:*** DLC.

(Problemy Arktiki, 1957. vyp. 2, p. 149–59, diagrs., table.) 4 refs. Text in Russian. ***Title tr.:*** Correlation of auroras, radio wave propagation and geomagnetic and ionospheric disturbances.

Auroral observations at the Tiksi Bay polar station Nov. 1955–Jan. 1956, were related to the audibility of radio signals of 24–69 mc. frequency, and the findings correlated with disturbances in horizontal component (H) of the earth's magnetic field and with data on the position of the reflectory layers (E) of the ionosphere. Clear reception of radio signals of undetermined stations, mostly in English and usually not perceptible at Tiksi Bay, coincided with bright or very bright

auroras, when records showed positive bays of H-component; during the negative bays, reception faded or disappeared; the negative bays coincided with low (100 km. or less) altitude of the E-layers. Types, phases, variations, disturbances and frequencies of these phenomena are discussed and their interrelations are shown on diagrams. ***Copy seen:*** DLC.

Informat͡sionnyĭ bûlleten', 1958, vyp. 11, p. 34–38.) Text in Russian. ***Title tr.:*** Preliminary data on the geologic structure of the far northwest of Bol'shezemel'skaya Tundra.

Outlines the stratigraphy, lithology and distribution of four series of Quaternary deposits in the region (approx. 68°–69° N. 54°–60° E.) between the Pechora estuary on the west and the lower More-Yu River-Khaypudyrskaya Bay on the east. The study is based on geological mapping in progress and on evaluation of previous studies. Deposits identified and briefly reviewed are: marine boreal transgressions, first Upper Quaternary glaciation, post-glacial-alluvial glaciation, and contemporary glaciation. Sands, clays and gravels are considered as building materials. ***Copy seen:*** DGS.

56149. ZAGORSKAIÂ, N. G. Sovremennoe oledenenie arkhipelaga Severnoĭ Zemli. (Vsesoûznoe geograficheskoe obshchestvo. Izvestiiâ, Nov.–Dec. 1957. t. 89, no. 6, p. 508–515, fold. map.) Ref. Text in Russian. ***Title tr.:*** The present-day glaciation of the Severnaya Zemlya Archipelago.

Summary of a part of the author's work *Geomorfologiiâ i chetvertichnye otlozheniiâ arkhipelaga Severnoĭ Zemli* (Geomorphology and Quaternary deposits of Severnaya Zemlya Archipelago), completed in 1953 and based on results of the Scientific Institute of Geology of the Arctic's Geological Expedition of 1948–51, headed by B. Kh. Elizarov, with author's participation in 1950–51. Of the 36,391 sq. km. surface of this archipelago, 45%, i.e., 16,908 sq. km., is covered by 22 glaciers; their size varies from 10 to 5,000 sq. km., and thickness from 20 to 400 m. Universitetskiy Glacier (1,605 sq. km.) on Oktyabr'skoy Revolyutsii Island, is

described in detail (p. 510–11) and typical features are noted of the other main glaciers (Kropotkina, Vavilova, Akademii Nauk, Al'banova, Dezhneva, etc.) shown on folded map, approx. 1:1,300,000. They appear to be in equilibrium: no evidence is found of present recession or extension; 25% of these glaciers are "active," but in the absence of steep slopes, the movement is slow and no formation of moraines or deposits is observed. ***Copy seen:*** DLC.

Moskva, 1942. vyp. 1, p. 35–56, illus. tables, graphs.) Text in Russian. ***Title tr.:*** Construction of airfields in deep snow.

Instructions are given for the construction of winter airfields in snow of 80–100 cm. depth. Excess snow is removed with tractor-propelled sleds and trucks, leaving an 8 cm. packed layer. The snow remaining on projected runways is compressed by rollers and graders, and mixed by gripper harrows, disc harrows, and cultivators; mixing doubles compactness after 24 hrs. at −12° C. and increases (six-fold) the initial hardness. Construction equipment (fig. 4–12) using local materials, simple tools (specified), unskilled army personnel is indicated.

Text in Russian. ***Title tr.:*** Lithology of Lower Cambrian deposits of the northern slope of the Aldan massif.

Presents results of investigation during 1950–1952 of the compaction, cementation, recrystallization and other changes and developments of Cambrian deposits of the Lena and Aldan regions. Occurrence of a marine basin in the Lower Cambrian is determined and its deposits are described. Sedimentation of dolomites is examined and facies defined; occurrence of bituminous and other organic material is studied. The bitumen (mineral oil, liquid fuel, tar, asphalt) is classified in several groups and the properties, content of bitumen, and organic mixtures indicated for each. Some of the bitumen may have practical importance. ***Copy seen:*** DLC.

56182. ZELENOV, KONSTANTIN KONSTANTINOVICH. O vynose rastvorennogo zheleza v Okhotskoe more gidrotermami vulkana Ėbeko, o. Paramushir. (Akademiâ nauk SSSR. Doklady, June 11, 1958. god 26, t. 120, no. 5, p. 1089–92.) 4 refs. Text in Russian. ***Title tr.:*** On iron in solution carried into Sea of Okhotsk by the hot springs of the Ebeko volcano, Paramushir Island.

Three types of hot springs in the fumarole fields and on the upper part of the Ebeko volcano cone are distinguished; their temperature, volume and discharge streams, of high acidity, are described. Three streams from the Ebeko thermal waters, which flow into the Sea of Okhotsk from this island (50°25′ N. 155°50′ E.) off the tip of Kamchatka, are treated in detail. Their chemical reactions with seawater are noted, especially with reference to the iron solution and its discharge. The effects on bottom sediments at various distances from the stream mouth are discussed. The assembled data are said to contribute toward an explanation of sea sedimentation in areas with volcanic activity, and they may lead to recovery of iron, possibly also of aluminum and manganese.

Text in Russian. ***Title tr.:*** Some Ordovician Tabulata of eastern Taymyr Peninsula.

Ordovician corals (oldest in coral fauna) from the Nizhnyaya Taymyra River area north of Lake Taymyr (approx. 73°50′–76° N. 96°–106° E.) are described from the fossil collections made during 1946–1952 by geologists of the Institute of Geology of the Arctic. The Ordovician deposits and their coral fauna, are outlined, locations of corals indicated, and types, species and varieties are described, several as new. The description is according to B. S. Sokolov's system with two groups: Tabulata Communicata Sokolov and T. Incommunicata Sokolov as separate subclasses of Anthozoa. A detailed classification is presented (fold. table). The similarity is noted of Taymyr Ordovician fauna to those of Greenland, Canada, Alaska, and other arctic regions.

56220. ZIETZ, ISIDORE, *and others.* Regional geologic interpretation of aeromagnetic profiles of selected areas in Alaska. (Geological Society of America. Bulletin, Dec. 1958. v. 69, no. 12, pt. 2, p. 1757.) Abstract of paper presented at the Ninth Alaskan Science Conference, College, Sept. 3–5, 1958. *Other authors:* G. E. Andreasen *and* W. J. Dempsey.

Describes results of aeromagnetic traverses over sedimentary basins: Yukon Flats and the adjacent Kandik Segment, the middle Tanana, and the Susitna lowlands north of Cook Inlet, also across many major tectonic elements from Anchorage to Nome. Magnetic data, presented in the form of profiles, indicate that the north end of the Cook Inlet Tertiary basin is shallow; near-surface volcanic rocks are probably present in the Yukon Flats basin; the west and east edges of the Talkeetna geanticline can be delineated; under the Alaska Range geosyncline, the Tanana geanticline, and most of the Kuskokwim geosyncline, the sedimentary section is thick, or the basement rocks are nonmagnetic; and there is no great thickness of sedimentary rocks under Norton Sound. ***Copy seen:*** DGS.

56221. ZIL'BERNIK, ALEKSANDR. Dvadtsat' vosem dneĭ na neobitaemom ostrove. (Vokrug sveta, Nov. 1958, no. 11, p. 33–37, illus., map.) Text in Russian. ***Title tr.:*** 28 days on uninhabited island.

Account of an expedition to Iony Island (56°29′ N. 143°20′ E.) in the Okhotsk Sea in Oct.–Nov. 1946 by a photographer who joined the trip. The Iony (or Kitoboy) Island, a rock protruding from the sea and surrounded by reefs, is almost inaccessible; an attempt was made during the war to establish a meteorological station there, but the rough seas prevented a landing. In 1945, an automatic weather station was set up on the island, but it was silenced a few weeks later, after a storm. In 1946 this party, headed by Gorelelchenko, an engineer, was sent to check and repair the installation. They landed successfully and after two weeks' hazardous work had almost finished the repair job when a severe storm once more destroyed the antenna. On Nov. 6, they left the island with a small and weak, though efficient, automatic station. The difficulties of scaling the steep coast and hard living conditions during the stay are noted. A great number of sea lions (sivuch) are said to lie along the coast. ***Copy seen:*** DLC.

56222. ZIL'BERNIK, ALEKSANDR. Goriachaia dolina. (Vokrug sveta, Feb. 1958, no. 2, p. 33–34, illus., map.) Ref. Text in Russian. ***Title tr.:*** A hot valley.

Reports trip of a motion picture party, headed by the producer, N. I. Tikhonov, in 1957, from Zhupanovo to the valley of geysers in the Shumnaya River basin near Kikhpinych Volcano in Kamchatka: the valley landscape with nearly a hundred geysers, their various intervals of activity, etc. Discovery of Kamchatka geysers by T. I. Ustinova in 1941–42 is noted. ***Copy seen:*** DLC.

This network comprised seven arctic stations in 1917, 17 in 1932, 80 in 1950 and 107 (including four seasonal navigation stations) in 1956. Since 1933, all polar stations have been administered by the Main Administration of the Northern Sea Route, though they work in close cooperation with the general meteorological service. Their personnel ranges from an average of 13 men at seven radiometeorological centers (Dikson Island, Tiksi Bay, Cape Chelyuskin, Cape Shmidta, etc.) to 3–4 in the navigation stations. Eighty-eight are coastal stations, 18 are on rivers and one at a lake, and all are hydrometeorological stations; 34 stations carry on aerological observations as well, and several stations study geophysical (geomagnetic, actinometric, ionospheric, glaciological, etc.) phenomena. The Arctic Institute maintains observatories at the Barentsburg and Tikhaya Bay stations. Further extension of the network is required as above the Arctic Circle in Asia, there is only one station per 55,000 sq. km., and in some areas only one/100–300,000 sq. km. The 107 stations are listed by name (p. 106–109) with location, year of foundation, coordinates, and notes on transfer, renaming, interruption of activities, etc. The northernmost station is on Rudolf Island (81°44′ N. 58° E.) and the southernmost at Gavriila Bay (Bering Sea, 62°25′ N. 179°08′ E.). This list is reprinted in No. 55109.

Popular account of the search for diamonds in Yakutia: diamond possibilities in the central plateau of Siberia were stated on theoretical grounds by two geologists, V. S. Sobolev and A. P. Burov (p. 6–8), and the search was begun in the Nizhnyaya Tunguska basin in 1947 by the Amakinskai͡a expedition of the Irkutsk Geological Administration (p. 3–27). From 1949, the search extended eastward and the first traces of diamonds were found in the Vilyuy River basin. The arctic tundras of the upper reaches of Markha River were explored, pyropes discovered in 1953, the kimberlite pipe "Zarnit͡sa" in 1954 (p. 57–72), and the rich kimberlite pipe "Mir" in the southern part of the Vilyuy basin (p. 72–79). Geophysical prospecting methods, discovery of diamantiferous fields on the Lena and Olenek watershed, founding of the settlement Mirnyy at kimberlite pipe "Mir," transportation difficulties and the beginning of work on a highway along the Lena between Mukhtuy and Mirnyy are described (p. 78–97). Achievements of the Amakinskai͡a Expedition, T͡Sentral'nai͡a Expedition of the Ministry of Geology and Conservation of Mineral Resources of the U.S.S.R., and of other

exploration parties are outlined and their leaders, geologists and successful searchers are characterized. The importance of the diamond discoveries to Soviet industry is stressed. Find of a 54.14 carat diamond in Yakutia is noted (p. 109); mention is made (p. 108) to a recent diamond discovery in the Mezen' District of Arkhangel'sk Province.

Text in Russian. ***Title tr.:*** Correlation of Quaternary deposits in the glaciated and non-glaciated areas in Siberia along the Yenisey River valley.

Presents a stratigraphic outline of Quaternary deposits in the areas of sea transgressions, glacial- and extra-glacial areas of the Yenisey valley from Krasnoyarsk to its mouth, based on author's 1954–1957 field investigations and others'. Ten climatic phases in the formation of Quaternary deposits and ten corresponding stratigraphic horizons are distinguished; they are briefly characterized in the fold. table by identifying characteristic fossils and location.

56253. ZUBAKOV, V. A. O lednikovo-morskikh otlozheniiakh Zapadnoĭ Sibiri i granitsakh rasprostraneniia sanchugovskoĭ transgressii po Eniseiu. (Akademiia nauk SSSR. Doklady, Aug. 21, 1957. t. 115, no. 6, p. 1161–64, 2 illus.) 7 refs. Text in Russian. ***Title tr.:*** On the glacial marine deposits of Western Siberia and the distributional boundaries of the Sanchugov transgression along the Yenisey River.

Study of the stratigraphy of Quaternary deposits in the Yenisey valley from the mouth of the Podkamennaya Tunguska River (61°30′ N.) to Karaul village (70° N.). The transition from morainic deposits of the Yenisey horizon to typical marine deposits of Sanchugov series is noted. A fauna of fossil marine molluscs was found in the bank outcrops of the Yenisey between 63° N. and 65° N.; the northern limit of Sanchugov transgression is near Plakhino on the Yenisey (67°40′ N.). Boulder clays of the valley can be divided into two horizons which belong to Sanchugov series. They cannot be considered as continental morainic deposits, but belong, apparently to, glacial marine formations of the so-called secondary Yenisey glaciation which coincided with the Sanchugov transgression of the sea.

56256. ZUBOV, NIKOLAĬ NIKOLAEVICH, 1885– . Davlenie vetra na ledĉanye polĉa. (*In his:* Izbrannye trudy po okeanologii. Moskva, 1955, p. 246–48, diagr., graph.) Text in Russian. ***Title tr.:*** Wind pressure on ice fields.

Contains theoretical discussion of the effect of wind pressure on an ice field with uneven surface. The wind's vertical components create irregular pressure even on an ice field with uniform surface, and cause horizontal fluctuations similar to waves on the sea surface; amplitudes of over three mm. were measured in 80 cm. thick ice on the Volga.

56257. ZUBOV, NIKOLAĬ NIKOLAEVICH, 1885– . Dreĭf l'dov po izobaram. (*In his:* Izbrannye trudy po okeanologii. Moskva, 1955, p. 294–311, maps, diagrs., tables.) Text in Russian. ***Title tr.:*** The drift of ice along isobars.

Presents the hypothesis, based on observations of the *Sedov* 1938–1939 in the Arctic Basin, that pure wind drift of solid ice in open waters takes place along courses parallel to the isobars, with the area of higher atmospheric pressure to the right, and the lower pressure to the left of the drift course. The mean deviation angle between wind and isobar, 28° to the left, coincides with the mean deviation between wind and ice drift, 28°–29° to the right. The speed of solid ice drifting with the wind is directly proportional to the gradient of atmospheric pressure, or inversely proportional to the distance between isobars. Values of computed drift are compared with observations of the drifts of the *Sedov*, *Lenin*, and North Pole drifting station 1937–38 (mapped). A theoretical discussion of ice movements in a crossing cyclone is presented. ***Copy seen:*** DLC.

56258. ZUBOV, NIKOLAĬ NIKOLAEVICH, 1885– . Izbrannye trudy po okeanologii; k 70-letiĉu so dnĉa rozhdeniĉa avtora. Moskva, Voen. izd-vo, 1955. 547 p., illus., tables, maps. Approx. 103 refs. Text in Russian. ***Title tr.:*** Selected works in oceanology; on the occasion of the author's 70th birthday.

Contains 33 papers preceded (p. 5–11) by a biographical sketch, and an outline (by A. D. Dobrovol'skiĭ) of Zubov's contributions to physical oceanography. The majority of papers deal with general problems of tides, currents and other movements of the sea (No. 33115), deposits, evaporation from the sea, effects of atmospheric factors (No. 19985), etc. Several papers discuss the problems of ice, conditions of its formation and melting, movements (No. 43461), ice islands (No. 43460). One paper deals with theoretical aspects of the regimen in lakes and canals. The first study in the series covers the hydrologic work conducted by the *Persei* in the southwestern areas of the Barents Sea in the summer of 1928 (No. 19976). The papers of arctic interest are abstracted *supra*, *infra*, or (as indicated) in earlier volumes of this Bibliography. A chronologically arranged list of the authors' publications (approx. 150) and a bibliographic guide (103 items) for these 33 papers conclude the collection.

56259. ZUBOV, NIKOLAĬ NIKOLAEVICH, 1885– . Izgib l'da pod gruzom. (*In his:* Izbrannye trudy po okeanologii. . . . Moskva, 1955, p. 215–23, diagrs.)

Text in Russian. ***Title tr.:*** Deflection of ice under load.

Discusses the effects of loads on an ice sheet under various conditions, including vibration caused by moving objects, and permanent deformation. Effects of concentrated loads are considered, and a formula for the relationship between the weight of a concentrated load and thickness, temperature and salinity of the ice, is derived. ***Copy seen:*** DLC.

56260. ZUBOV, NIKOLAĬ NIKOLAEVICH, 1885– . K teorii torosheniĭa morskikh l'dov. (*In his:* Izbrannye trudy po okeanologii . . . Moskva, 1955, p 249–58, diagrs.) Text in Russian. ***Title tr.:*** Theory on the jamming of sea ice.

Offers a theoretical approach to the explanation of processes taking place when two ice sheets collide, or when an ice sheet collides with an immobile mass (seashore). Effects of thawing and freezing during jamming are not considered, and the ice is assumed to be rigid. Distribution of kinetic energy, and effect of prevailing winds during the jamming process are discussed. A measure for the decrease in area of an ice sheet, expressed in percentages of the original size, is presented.

56261. ZUBOV, NIKOLAĬ NIKOLAEVICH, 1885– . K voprosu o ventiliâtsii pridonnykh vod moriâ. (Leningrad. Gosudarstvennyĭ gidrologicheskiĭ institut. Issledovaniâ morei SSSR, 1931. vyp. 12, p. 151–64, illus. tables.) 14 refs. Text in Russian. Summary in English. ***Title tr.:*** The problem of ventilation in marine bottom waters.

Of the three main factors instrumental in aeration of sea water, the author discusses winter cooling as being responsible for vertical circulation and essential in oxygenation of bottom waters. The dynamics of this process are worked out mathematically from observations in the Barents Sea, and the role of the ice cover in this process determined. Based on these calculations, it is determined when and under which conditions surface water reaches the bottom in this area.

"Evaporation from the surface of sea ice and water is discussed; related investigations are briefly outlined; and the importance of studying the transfer of salt particles from the sea to the atmosphere is noted. The intensity of evaporation from ice, snow and water surfaces is a function of temperature differences between the air and the ice surface and conditions of air exchange near the surface. Evaporation occurs when the sea surface (water or ice) is warmer than the air. The intense evaporation observed in the Arctic from thin layers of ice is a result of the ease with which the ice is warmed by the water."—SIPRE.

56264. ZUBOV, NIKOLAĬ NIKOLAEVICH, 1885– . O pokazatele nespokoĭnosti atmosfery. (*In his:* Izbrannye trudy po okeanologii . . . Moskva, 1955. p. 171–76, table, graph, maps.) Text in Russian. ***Title tr.:*** Characteristics of atmospheric turbulence.

Indicates use of atmospheric pressure observations for long-term forecasts of ice conditions. Variation in atmospheric pressure in mb./24 hrs. for a 12-month period 1934–35 at seven stations along the Northern Sea Route is tabulated and discussed. Similar observations for Dikson Island for the period 1916–38 are graphed, and isoline charts for the northern coast of U.S.S.R. for June–July 1939 are presented. ***Copy seen:*** DLC.

56265. ZUBOV, NIKOLAĬ NIKOLAEVICH, 1885– . O sosushchestvovanii

vody i l'da (*In his:* Izbrannye trudy po okeanologii . . . Moskva, 1955, p. 183–87.) Text in Russian. ***Title tr.:*** The coexistence of water and ice.

Presents formulas for the thermal and saline reciprocal action between ice and water, and describes the actions which take place under given circumstances. The formulas are applied to actual conditions to illustrate salinity and temperature decreases by ice melting under arctic conditions. ***Copy seen:*** DLC.

56266. ZUBOV, NIKOLAĬ NIKOLAEVICH, 1885– . Prilivo-otlivnye dvizheniĭa morskikh l'dov i ponĭatie o ledovom chase. (*In his:* Izbrannye trudy po okeanologii . . . Moskva, 1955, p. 266–70, diagr., table.) Text in Russian. ***Title tr.:*** Tidal movements of sea ice and the meaning of the ice hour.

Attributes the tidal process of squeezing and thinning of ice fields to the varied effect of tidal influence at different locations at a given time. Effects of winds of varied directions are considered. The ice hour is defined as the mean time interval between the moment of upper culmination of the moon and the next squeeze of the ice at a given point at sea. Practical application of the knowledge of the ice hour for navigational purposes is explained, and exemplified from experiences in the Laptev Sea.

56267. ZUBOV, NIKOLAĬ NIKOLAEVICH, 1885– . Soobrazheniĭa o dvizhenii l'dov pod vliĭaniem vetra. (Leningrad. Gosudarstvennyĭ gidrologicheskiĭ institut. Issledovaniĭa moreĭ SSSR, 1935. vyp. 21, p. 113–19, illus.) 3 refs. Text in Russian. Summary in German. ***Title tr.:*** Considerations on ice movements under the influence of wind.

An analytical study of ice movement as affected by wind speed, earth rotation, ice thickness and altitude. Practical conclusions are drawn regarding distribution and movement of ice and suggestions regarding navigation in ice regions are made. ***Copy seen:*** DLC.

56268. ZUBOV, NIKOLAĬ NIKOLAEVICH, 1885– . Taĭanie l'dov v rezul'tate teplogo vozdeĭstviĭa atmosfery i moriĭa. (*In his:* Izbrannye trudy po okeanologii . . . Moskva, 1955, p. 259–65, tables.) Text in Russian. ***Title tr.:*** Ice melting due to heating effects of atmosphere and sea.

Contains an approximate theoretical evaluation of decrease in ice thickness with time as a result of solar radiation and heat transfer in the air. Decrease due to heat transfer from the sea as a function of time is expressed as proportional to ice thickness and inversely proportional to the quantity of heat absorbed by the water.

Copy seen: DLC.

56269. ZUBOV, NIKOLAĬ NIKOLAEVICH, 1885– . Veter i dreĭf l'dov. (*In his:* Izbrannye trudy po okeanologii . . . Moskva, 1955, p. 271–93, diagrs., tables.) Text in Russian. ***Title tr.:*** Wind and the drift of ice.

"Wind pressure on a continuous ice mass causes drift. Drifting ice effects a flow of water generally in the direction of the ice drift. Wind causes a surface water flow, and small ice floes to drift at the same rate as the water in large areas of water. The drift of ice fragments depends on the concentration of ice floes. The drift of fragments resembles the drift of a continuous ice mass when 75% of the water surface is ice-covered, and that of a single ice floe when the coverage is smaller."—SIPRE. ***Copy seen:*** DLC.

68. Kamchatka, Poluostrov
69. Komandorskiye Ostrova

The Government of the United States has not recognized the incorporation of Estonia, Latvia, and Lithuania into the Soviet Union; nor does it recognize as final the de facto western limit of Polish Administration in Germany (the Oder-Neisse Line); some other effective boundaries do not necessarily correspond to the boundaries recognized by the United States Government.
